3 Credits  This course stresses basic concepts essential to understanding the action of exogenous chemical agents on biological systems. The course covers principles of absorption and the effects of chemical agents on metabolism. The pathways of metabolism of these compounds and the principles of elimination from biological systems are discussed. The course includes discussion of toxicokinetics, types of toxic responses and the current experimental methods of toxicity.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 9963 MS Project in Civil & Urban Engineering

3 Credits  This project involves analytical, design or experimental studies in civil engineering guided by a faculty adviser and following departmental guidelines. A written report is required.

Prerequisite(s): Degree status and project adviser’s approval.

CE 997X MS Thesis in Civil & Urban Engineering Department

6 Credits  This course is an original investigation or design in the student’s principal field of study prepared and closely supervised by a faculty adviser. Candidates must successfully defend theses orally. Registration for a minimum of 6 credits is required.
Prerequisite(s): Degree status and thesis adviser’s approval.

3. Nine credits of approved elective courses

Total: 30 Credits

Financial Engineering, Computational Finance Track, M.S.

Requirements for the Master of Science

A Bachelor’s degree is required for admission to this program. It is expected that students will have superior mathematical talent. Students with degrees in other fields may be admitted, possibly with undergraduate deficiencies, at the discretion of departmental advisers. Before beginning graduate studies, conditionally approved students must demonstrate proficiency in basic statistics, probability and mathematics. The Department makes available refresher courses for this purpose and to serve the population of students who have been out of academia prior to matriculating into this program. Prerequisites: GRE exam scores (GMAT may be substituted, but GRE is strongly preferred), Calculus (MA 1124 or equivalent) Probability and Statistics (MA 2212 and MA 2222 or equivalent), and Linear Algebra (MA 2012 or equivalent).

Master's in Financial Engineering: 33 Credits

All tracks include in their program:

- 5 core courses, each 3 Credits
- Track required courses totaling 7.5 Credits
- 1 required applied lab, worth 1.5 Credits
- 4 elective courses, each 1.5 Credits
- 1 Capstone Experience of 3 Credits

All MS Financial Engineering students must also complete the Bloomberg Essentials Online Training Program to be qualified for graduation. The Department of Finance and Risk Engineering supports students’ efforts in this area by providing many Bloomberg terminals and laboratory assistants to answer student questions. This is a zero-credit requirement that is listed here as FRE 5500.

Core Courses (Required):

FRE 6003 Financial Accounting

3 Credits This course provides a solid foundation in the construction and interpretation of financial statements. Topics include accounting terminology; financial statement preparation and analysis; liquidity and credit risk ratios; depreciation calculations; revenue recognition; and accrued liabilities and asset valuation. Also covered are the effects of equity transactions; cash flows; and various accounting methods on financial statements.
FRE 6023 Economic Foundations in Finance

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

FRE 6103 Corporate Finance

3 Credits The modern corporation, as issuer of financial securities and end-user of financial risk management products, is a major participant in financial markets and the economic counterpart to investors and financial intermediaries. The mechanism of financial markets and the valuation of instruments are studied in further detail in other courses. However, this course applies the tools of the trade of financial economics and corporate finance to the financial decision-making process of firms. Upon successful completion of this course, students know how to contribute to optimal financial decisions in a corporation: valuation; capital budgeting; risk; capital structure; dividend policy; long-term financing; risk management; and mergers and acquisitions. Increasingly important international factors that affect corporate finance are stressed throughout.

FRE 6123 Financial Risk Management and Asset Pricing

3 Credits This course introduces the techniques and problems of Financial Risk Management and Asset Pricing. It emphasizes risk finance and attitudes; Value at Risk; risk measurement principles; valuation and expected utility and their relevance in the valuation and the pricing of financial investments; insurance; management of derivatives; and risk management. Throughout, risk-management application problems are explored. The course introduces and focuses on the fundamental principles of the Arrow-Debreu state preference theory used to price derivatives and other assets in complete markets. Risk neutral-Binomial models in option pricing; essential elements of Ito calculus; and the Black-Scholes model for pricing options are introduced and applied to practical financial decision making and risk management problems.

FRE 6083 Quantitative Methods in Finance

3 Credits This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

Prerequisite(s): Students are expected to know calculus and elementary probability.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:
* For Risk Finance the 6 credits comprising FRE 6003 and FRE 6083 are replaced by FRE 6021, FRE 6051, and FRE 6223.

All tracks: Core courses = 15 Credits.

Incoming MS students of Financial Engineering have four track options. Each track has required courses totaling 7.5 credits (except Risk Finance which requires 10.5 credits).

- Financial Markets and Corporate Finance
- Computational Finance
- Technology and Algorithmic Finance
- Risk Finance (Credit Risk, Financial Management and Insurance)

Required Labs per Track: 1.5 Credits

Students from all tracks must choose one of the following labs for 1.5 credits:

**FRE 6811 Financial Software Laboratory**

*1.5 Credits* This course teaches students to use financial software tools commonly employed in industry. Examples include: @Risk, Yieldbook, Excel, R, and C++.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6821 Financial Econometrics Laboratory**

*1.5 Credits* This course teaches students to use financial econometrics software. Examples include: Eviews, Stata and others.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6831 Computational Finance Laboratory**

*1.5 Credits* This course teaches students to use the software tools employed in computational finance. Examples include: MATLAB, GAMS and other optimization software.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6861 Financial Software Engineering**

*1.5 Credits* This financial lab requires students to publicly participate in a large software project. This participation could take the form of innovation, such as contributing to an open-source financial software project with the contributions being accepted and committed to the main branch, or invention, such as publishing a stand-alone library or package for a programming language commonly used in financial applications, or pure entrepreneurship, such as the development or updating of a brand-new industrial strength financial software application. As the students work on their project, this course will focus on important software engineering considerations specifically as they apply to the real-time world of financial projects, such as formalized procedures for revision control and bug tracking and other proven methods of software management in a fast-paced financial and business environment.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Required Certification: 0 Credits

All students must complete the following certification:

**FRE 5500 Bloomberg Certification**

0 Credits The required Bloomberg certification is a self-taught, self-paced process available on any Bloomberg terminal. Upon completion and receipt of the certification, the student’s requirement in this area will be deemed complete. This requirement can be completed at any time prior to the end of the financial lab course, even before beginning the Master’s in Financial Engineering program if a student so chooses, but no later than the last class of the semester in which the lab course is taken.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Capstone Options: 3 Credits

**FRE 9973 MS Thesis in Finance & Risk Engineering**

3 Credits In this research course, students undertake proprietary or non-proprietary research and write a thesis-type research paper. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within guidelines established by the supervising faculty member.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the thesis project.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7023 Financial Engineering Capstone: Internship**

3 Credits In this course, the Career Management Center helps the student to secure an internship. Students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A paper based on the internship work is required. This course is graded on the S/U basis.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the internship.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7043 Financial Engineering Capstone: Project**

3 Credits In this project course, students work with faculty on proprietary or non-proprietary research projects. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A significant written research component is required.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s
track and the nature of the project to be undertaken.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Two special topics courses at 1.5 credits each, with a capstone paper submitted to the faculty.

Computational Finance Track

Five of the following six courses:

**FRE 6231 Stochastic Calculus and Financial Modeling**

*1.5 Credits* This course extends the core course FE6083 to Stochastic Calculus in Finance, emphasizing the modeling approach and resolution of important problems in derivatives finance, in pricing assets and complex financial products. In addition, cases highlighting the impact of theoretical finance on market trading, investment and portfolio management and related problems are emphasized. Some of the techniques used include Markov chains, random walks, stochastic differential equations and Ito Calculus, optimal stochastic control and stochastic dynamic programming as well as Monte Carlo simulation. These techniques are applied to selected financial engineering models to assess and simulate (using MATLAB and other software) essential derivative and related problems of practical importance in finance.

*Prerequisite(s):* FRE 6083.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6251 Numerical and Simulation Techniques in Finance**

*1.5 Credits* The course presents advanced numerical techniques to solve ordinary, partial and stochastic differential equations. These techniques are analyzed mathematically and use computer aided software that allows for the solution and the handling of such problems. In addition, the course introduces techniques for Monte Carlo simulation techniques and their use to deal with theoretically complex financial products in a tractable and practical manner. Both self-writing of software as well as using outstanding computer programs routinely employed in financial and insurance industries will be used.

*Prerequisite(s):* FRE 6083.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6311 Dynamic Assets and Options Pricing**

*1.5 Credits* The course focuses on inter-temporal assets pricing in discrete and continuous time. The course explores problems in complete and incomplete markets of both theoretical and practical interest that require an appreciation of financial economic theories and computational techniques. Financial-engineering techniques are introduced including Martingales, stochastic calculus and jump processes; these are applied to engineering problems in finance. Problems and cases are presented that span Stocks and Derivatives (options of various sorts), Bonds and Implied Risk-Neutral Pricing.

*Prerequisite(s):* FRE 6083 and FRE 6123.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 6331 Financial Risk Management and Optimization

1.5 Credits This course provides solutions to the inter-temporal problems in financial management including management of portfolios, credit risks and market making. Dynamic and stochastic dynamic programming techniques as well as optimal control and stochastic control principles of optimality are presented, and their financial contexts emphasized. Both theoretical and practical facets of inter-temporal management of financial risks and risk pricing are also stressed. The course uses financial and optimization software to solve problems practically.

Prerequisite(s): FRE 6083, FRE 6091 and FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6351 Advanced Financial Econometrics

1.5 Credits Financial econometrics has matured into a necessary and essential part of financial engineering that provides opportunities to deal with real and practical problems in finance. For example, techniques such as ARCH and GARCH and their subsequent development are used to estimate the volatility of underlying financial processes; the analysis of intraday trading data that requires particular models and techniques; memory-based and fractal stochastic processes to study complex markets behaviors and copulas applied routinely to model- and estimate-dependent risks. These financial and risk problems require the application of advanced financial-econometric techniques, which the course provides from both theoretical and empirical-applied viewpoints. Selected cases provide a real-world sense of financial engineering when it is faced with financial-market reality and complexity.

Prerequisite(s): FRE 6083.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6041 Risk Management in the Real World

1.5 Credits The course covers failures of financial theory in risk management, deriving from fundamental definitions and assumptions in modeling, including pricing formulae; convexity; stochasticity and volatility; “fat tails”; and risk. Other topics: Portfolio robustness and extreme markets and moral hazard; datamining biases and decision error; and decision-making with incomplete information.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Credit Allocation for Financial Markets and Corporate Finance, Computational Finance, and Financial Information Services and Technology tracks:

Core Courses: 15
Required Courses: 7.5
Elective Credits: 6
Lab: 1.5
Total Credits: 33

All these options require a review by faculty advisers and certification of satisfactory work.

Financial Engineering, Financial Markets and Corporate Finance Track, M.S.

Requirements for the Master of Science

A Bachelor’s degree is required for admission to this program. It is expected that students will have superior mathematical talent. Students with degrees in other fields may be admitted, possibly with undergraduate deficiencies, at the discretion of departmental advisers. Before beginning graduate studies, conditionally approved students must demonstrate proficiency in basic statistics, probability and mathematics. The Department makes available refresher courses for this purpose and to serve the population of students who have been out of academia prior to matriculating into this program. Prerequisites: GRE exam scores (GMAT may be substituted, but GRE is strongly preferred), Calculus (MA 1124 or equivalent) Probability and Statistics (MA 2212 and MA 2222 or equivalent), and Linear Algebra (MA 2012 or equivalent).

Master’s in Financial Engineering: 33 Credits

All tracks include in their program:

- 5 core courses, each 3 Credits
- Track required courses totaling 7.5 Credits
- 1 required applied lab, worth 1.5 Credits
- 4 elective courses, each 1.5 Credits
- 1 Capstone Experience of 3 Credits

All MS Financial Engineering students must also complete the Bloomberg Essentials Online Training Program to be qualified for graduation. The Department of Finance and Risk Engineering supports students’ efforts in this area by providing many Bloomberg terminals and laboratory assistants to answer student questions. This is a zero-credit requirement that is listed here as FRE 5500.

Core Courses (Required):

FRE 6003 Financial Accounting

3 Credits This course provides a solid foundation in the construction and interpretation of financial statements. Topics include accounting terminology; financial statement preparation and analysis; liquidity and credit risk ratios; depreciation calculations; revenue recognition; and accrued liabilities and asset valuation. Also covered are the effects of equity transactions; cash flows; and various accounting methods on financial statements.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6023 Economic Foundations in Finance
This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6103 Corporate Finance**

This course introduces the techniques and problems of Financial Risk Management and Asset Pricing. It emphasizes risk finance and attitudes; Value at Risk; risk measurement principles; valuation and expected utility and their relevance in the valuation and the pricing of financial investments; insurance; management of derivatives; and risk management. Throughout, risk-management application problems are explored. The course introduces and focuses on the fundamental principles of the Arrow-Debreu state preference theory used to price derivatives and other assets in complete markets. Risk neutral-Binomial models in option pricing; essential elements of Ito calculus; and the Black-Scholes model for pricing options are introduced and applied to practical financial decision making and risk management problems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6123 Financial Risk Management and Asset Pricing**

This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

*Prerequisite(s): Students are expected to know calculus and elementary probability.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6083 Quantitative Methods in Finance**

*For Risk Finance the 6 credits comprising FRE 6003 and FRE 6083 are replaced by FRE 6021, FRE 6051, and FRE 6223.*

All tracks: Core courses = 15 Credits.
Incoming MS students of Financial Engineering have four track options. Each track has required courses totaling 7.5 credits (except Risk Finance which requires 10.5 credits).

- Financial Markets and Corporate Finance
- Computational Finance
- Technology and Algorithmic Finance
- Risk Finance (Credit Risk, Financial Management and Insurance)

Required Labs per Track: 1.5 Credits

Students from all tracks must choose one of the following labs for 1.5 credits:

**FRE 6811 Financial Software Laboratory**

1.5 Credits This course teaches students to use financial software tools commonly employed in industry. Examples include: @Risk, Yieldbook, Excel, R, and C++.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6821 Financial Econometrics Laboratory**

1.5 Credits This course teaches students to use financial econometrics software. Examples include: Eviews, Stata and others.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6831 Computational Finance Laboratory**

1.5 Credits This course teaches students to use the software tools employed in computational finance. Examples include: MATLAB, GAMS and other optimization software.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6861 Financial Software Engineering**

1.5 Credits This financial lab requires students to publicly participate in a large software project. This participation could take the form of innovation, such as contributing to an open-source financial software project with the contributions being accepted and committed to the main branch, or invention, such as publishing a stand-alone library or package for a programming language commonly used in financial applications, or pure entrepreneurship, such as the development or updating of a brand-new industrial strength financial software application. As the students work on their project, this course will focus on important software engineering considerations specifically as they apply to the real-time world of financial projects, such as formalized procedures for revision control and bug tracking and other proven methods of software management in a fast-paced financial and business environment.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Required Certification: 0 Credits
All students must complete the following certification:

**FRE 5500 Bloomberg Certification**

0 Credits The required Bloomberg certification is a self-taught, self-paced process available on any Bloomberg terminal. Upon completion and receipt of the certification, the student’s requirement in this area will be deemed complete. This requirement can be completed at any time prior to the end of the financial lab course, even before beginning the Master’s in Financial Engineering program if a student so chooses, but no later than the last class of the semester in which the lab course is taken.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Capstone Options: 3 Credits**

**FRE 9973 MS Thesis in Finance & Risk Engineering**

3 Credits In this research course, students undertake proprietary or non-proprietary research and write a thesis-type research paper. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within guidelines established by the supervising faculty member.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the thesis project.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7023 Financial Engineering Capstone: Internship**

3 Credits In this course, the Career Management Center helps the student to secure an internship. Students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A paper based on the internship work is required. This course is graded on the S/U basis.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the internship.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7043 Financial Engineering Capstone: Project**

3 Credits In this project course, students work with faculty on proprietary or non-proprietary research projects. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A significant written research component is required.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the project to be undertaken.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
- Two special topics courses at 1.5 credits each, with a capstone paper submitted to the faculty.

**Financial Markets and Corporate Finance Track**
Five of the following six courses:

**FRE 6091 Financial Econometrics**

*1.5 Credits* This course focuses on the art and science of statistical modeling of processes applied to business, finance and economics. These may include models of aggregate economic activity, economic behavior of firm or behavior of financial assets. Topics include statistical inference; maximum likelihood estimation; method of moments; Bayesian estimation; least-squares estimation; robust estimation; kernel estimation; copula estimation; analysis of variance; linear regression models; multiple regression; logistic regression; quantile regression; time series estimation; unit root tests; bootstrapping.

*Prerequisite(s):* FRE 6083. *Students are expected to know basic statistics.*

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6291 Applied Derivative Contracts**

*1.5 Credits* This course provides an introduction to derivative contracts with a special emphasis on current practical applications in use today by financial institutions for investing, hedging, trading and issuing. The characteristics and features of futures, forwards, swaps, options and structured notes are all covered with a special emphasis on useful applications. For each of the four primary derivative contracts, we review in these lectures the appropriate definitions, terminology, market mechanics and theoretical fair value pricing.

*Prerequisite(s):* FRE 6003, FRE 6023, FRE 6103 and graduate standing

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6411 Fixed Income Securities and Interest Rate Derivatives**

*1.5 Credits* This course examines the body of analytical tools and measures that constitute modern fixed-income markets. The valuation of interest-rate sensitive cash flows is the unifying theme. Major topics include theories of term structure, institutional aspects of fixed-income markets and analytical techniques for managing interest-rate risk. Bond refunding, defeasance, corporate bonds, forwards, futures, options and interest-rate swaps are discussed. The course gives an overview of the major classes of fixed-income securities and the markets in which they trade. Among the major classes of fixed-income instruments discussed are Treasury and agency securities, mortgage-backed securities (including CMOs and Strips), asset-backed securities, municipals, floating and inverse floating rate securities.

*Prerequisite(s):* FRE 6023, FRE 6083 and FRE 6103.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6711 Investment Theory and Applications**

*1.5 Credits* This course examines in-depth modern portfolio theory and investment selection. It considers the mathematics of portfolio analysis, single-period risk and return measures and the process of optimal portfolio selection. The basic portfolio model is extended to consider alternative risk concepts and multi-period portfolio horizons. Single-factor and multifactor models are discussed. Optimization techniques, such as linear programming and quadratic programming, are applied. The basic portfolio model is extended to explain hedging theory and to build firm-wide risk management models.
Prerequisite(s): FRE 6411 and FRE 6511.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6271 Valuation of Equity Securities and Financial Statement Analysis**

*1.5 Credits* This course examines in detail the tools and techniques for analyzing financial statements for purposes of credit evaluation, forecasting, identifying merger candidates, enhancing the efficiency of decision making and diagnosing problem areas in the firm before crises develop. Students learn to use financial ratios to conduct duPont (i.e., decomposition) analysis, a methodology to discover sources of poor performance through interrelationships among a firm’s financial ratios.

Prerequisite(s): FRE 6003 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6041 Risk Management in the Real World**

*1.5 Credits* The course covers failures of financial theory in risk management, deriving from fundamental definitions and assumptions in modeling, including pricing formulae; convexity; stochasticity and volatility; “fat tails”; and risk. Other topics: Portfolio robustness and extreme markets and moral hazard; datamining biases and decision error; and decision-making with incomplete information.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Track required courses totaling 7.5 Credits
- 1 required applied lab, worth 1.5 Credits
- 4 elective courses, each 1.5 Credits
- 1 Capstone Experience of 3 Credits

All MS Financial Engineering students must also complete the Bloomberg Essentials Online Training Program to be qualified for graduation. The Department of Finance and Risk Engineering supports students’ efforts in this area by providing many Bloomberg terminals and laboratory assistants to answer student questions. This is a zero-credit requirement that is listed here as FRE 5500.

Core Courses (Required):

**FRE 6003 Financial Accounting**

3 Credits This course provides a solid foundation in the construction and interpretation of financial statements. Topics include accounting terminology; financial statement preparation and analysis; liquidity and credit risk ratios; depreciation calculations; revenue recognition; and accrued liabilities and asset valuation. Also covered are the effects of equity transactions; cash flows; and various accounting methods on financial statements.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6023 Economic Foundations in Finance**

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6103 Corporate Finance**

3 Credits The modern corporation, as issuer of financial securities and end-user of financial risk management products, is a major participant in financial markets and the economic counterpart to investors and financial intermediaries. The mechanism of financial markets and the valuation of instruments are studied in further detail in other courses. However, this course applies the tools of the trade of financial economics and corporate finance to the financial decision-making process of firms. Upon successful
completion of this course, students know how to contribute to optimal financial decisions in a corporation: valuation; capital budgeting; risk; capital structure; dividend policy; long-term financing; risk management; and mergers and acquisitions. Increasingly important international factors that affect corporate finance are stressed throughout.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6123 Financial Risk Management and Asset Pricing

3 Credits This course introduces the techniques and problems of Financial Risk Management and Asset Pricing. It emphasizes risk finance and attitudes; Value at Risk; risk measurement principles; valuation and expected utility and their relevance in the valuation and the pricing of financial investments; insurance; management of derivatives; and risk management. Throughout, risk-management application problems are explored. The course introduces and focuses on the fundamental principles of the Arrow-Debreu state preference theory used to price derivatives and other assets in complete markets. Risk neutral-Binomial models in option pricing; essential elements of Ito calculus; and the Black-Scholes model for pricing options are introduced and applied to practical financial decision making and risk management problems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6083 Quantitative Methods in Finance

3 Credits This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

Prerequisite(s): Students are expected to know calculus and elementary probability.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

* For Risk Finance the 6 credits comprising FRE 6003 and FRE 6083 are replaced by FRE 6021, FRE 6051, and FRE 6223.

All tracks: Core courses = 15 Credits.

Incoming MS students of Financial Engineering have four track options. Each track has required courses totaling 7.5 credits (except Risk Finance which requires 10.5 credits).

- Financial Markets and Corporate Finance
- Computational Finance
- Technology and Algorithmic Finance
- Risk Finance (Credit Risk, Financial Management and Insurance)

Required Labs per Track: 1.5 Credits

Students from all tracks must choose one of the following labs for 1.5 credits:

FRE 6811 Financial Software Laboratory
1.5 Credits This course teaches students to use financial software tools commonly employed in industry. Examples include: @Risk, Yieldbook, Excel, R, and C++.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6821 Financial Econometrics Laboratory**

1.5 Credits This course teaches students to use financial econometrics software. Examples include: Eviews, Stata and others.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6831 Computational Finance Laboratory**

1.5 Credits This course teaches students to use the software tools employed in computational finance. Examples include: MATLAB, GAMS and other optimization software.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6861 Financial Software Engineering**

1.5 Credits This financial lab requires students to publicly participate in a large software project. This participation could take the form of innovation, such as contributing to an open-source financial software project with the contributions being accepted and committed to the main branch, or invention, such as publishing a stand-alone library or package for a programming language commonly used in financial applications, or pure entrepreneurship, such as the development or updating of a brand-new industrial strength financial software application. As the students work on their project, this course will focus on important software engineering considerations specifically as they apply to the real-time world of financial projects, such as formalized procedures for revision control and bug tracking and other proven methods of software management in a fast-paced financial and business environment.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Required Certification: 0 Credits**

All students must complete the following certification:

**FRE 5500 Bloomberg Certification**

0 Credits The required Bloomberg certification is a self-taught, self-paced process available on any Bloomberg terminal. Upon completion and receipt of the certification, the student’s requirement in this area will be deemed complete. This requirement can be completed at any time prior to the end of the financial lab course, even before beginning the Master’s in Financial Engineering program if a student so chooses, but no later than the last class of the semester in which the lab course is taken.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Capstone Options: 3 Credits**
FRE 9973 MS Thesis in Finance & Risk Engineering

3 Credits In this research course, students undertake proprietary or non-proprietary research and write a thesis-type research paper. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within guidelines established by the supervising faculty member.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the thesis project.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7023 Financial Engineering Capstone: Internship

3 Credits In this course, the Career Management Center helps the student to secure an internship. Students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A paper based on the internship work is required. This course is graded on the S/U basis.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the internship.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7043 Financial Engineering Capstone: Project

3 Credits In this project course, students work with faculty on proprietary or non-proprietary research projects. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A significant written research component is required.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the project to be undertaken.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
  - Two special topics courses at 1.5 credits each, with a capstone paper submitted to the faculty.

Risk Finance

Note: this track has 10.5 credits of required course work, no lab requirement and fewer elective credits. Further, for this track only, the 6 credits of core courses FRE 6003 and FRE 6083 are replaced by FRE 6021, FRE 6051 and FRE 6223.

Risk Finance Track Required:

FRE 6051 Finance Insurance

1.5 Credits This course highlights essential facets of actuarial science, insurance and finance insurance. The course assumes that students are familiar with basic notions of expected utility and stochastic processes, and options pricing. Topics include Insurance Business and Insurance Firms Management; Principles of Actuarial Science and Risk Pricing by both actuarial (historic and data based) and financial approaches (based on implied estimates of future losses). The expected Utility Approach to Insurance Risk
Pricing and Management is briefly reviewed and greater attention is given to financial insurance derivatives; pricing Insurance Products (Life Insurance, Casualty, Pension Funds and Defined Benefits). The course concludes with an appreciation of the Principles of Insurance Management in a Dynamic and Global Setting. Throughout, the course uses numerous cases centered on financial insurance and actuarial problems and analyzes them from a financial markets perspective. Particular problems such as insurance pension funds, CATBOND and weather (insurance) derivatives and regulation are presented as case problems.

Prerequisite(s): FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6491 Municipal and Public Finance

1.5 Credits This course provides an overview and analysis of the market for debt obligations of state and local governments. Topics will include the micro structure of the market, including the types of debt issued, and characteristics of the buyers. Federal and state taxation of munis will be discussed, along with industry regulatory structure. Bond structure, risk assessment and risk management using cash bonds, futures and options will be covered.

Prerequisite(s): FRE 6411.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6611 Credit Derivatives

1.5 Credits This course introduces credit derivatives and Collateralized Debt Obligations (CDO’s). The course reviews the most important credit instruments and their marketing, starting with risky bonds and credit default swaps, through basket swaps, structured products and CDO’s. Each instrument is defined and explained, including its markets, modeling, pricing and risk management. Class work is illustrated with theoretical homework and practical Excel projects.

Prerequisite(s): FRE 6411 and FRE 6511
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6671 Global Finance

1.5 Credits This course covers the international dimensions of finance. It focuses on markets, players and instruments. It explores the main theoretical insights into the workings of the foreign exchange, international currency and bond markets, and how their integration is used to price securities.

Prerequisite(s): FRE 6411 and FRE 6511.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6731 Basel 2 and Value at Risk

1.5 Credits This course addresses financial risk management and particularly focuses on Basel 2 directives and Value at Risk (VaR), a method to assess risk that employs standard statistical techniques routinely used in other fields. VaR analysis is used by bank and corporate managers and by financial market regulators.

Corequisite(s): FRE 6711.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Recommended Electives* (6 Credits)

**FRE 6041 Risk Management in the Real World**

*1.5 Credits* The course covers failures of financial theory in risk management, deriving from fundamental definitions and assumptions in modeling, including pricing formulae; convexity; stochasticity and volatility; "fat tails"; and risk. Other topics: Portfolio robustness and extreme markets and moral hazard; datamining biases and decision error; and decision-making with incomplete information.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6231 Stochastic Calculus and Financial Modeling**

*1.5 Credits* This course extends the core course FE6083 to Stochastic Calculus in Finance, emphasizing the modeling approach and resolution of important problems in derivatives finance, in pricing assets and complex financial products. In addition, cases highlighting the impact of theoretical finance on market trading, investment and portfolio management and related problems are emphasized. Some of the techniques used include Markov chains, random walks, stochastic differential equations and Ito Calculus, optimal stochastic control and stochastic dynamic programming as well as Monte Carlo simulation. These techniques are applied to selected financial engineering models to assess and simulate (using MATLAB and other software) essential derivative and related problems of practical importance in finance.

*Prerequisite(s):* FRE 6083.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6351 Advanced Financial Econometrics**

*1.5 Credits* Financial econometrics has matured into a necessary and essential part of financial engineering that provides opportunities to deal with real and practical problems in finance. For example, techniques such as ARCH and GARCH and their subsequent development are used to estimate the volatility of underlying financial processes; the analysis of intraday trading data that requires particular models and techniques; memory-based and fractal stochastic processes to study complex markets behaviors and copulas applied routinely to model- and estimate-dependent risks. These financial and risk problems require the application of advanced financial-econometric techniques, which the course provides from both theoretical and empirical-applied viewpoints. Selected cases provide a real-world sense of financial engineering when it is faced with financial-market reality and complexity.

*Prerequisite(s):* FRE 6083.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6791 Operational Risk Measurement and Management**

*1.5 Credits* The operational difficulties faced by financial institutions have created a need for tools to measure and manage operational risk. An accurate appreciation of risks, exposures and controls is critical to managing risk effectively in today’s dynamic global business environment. This course examines the effects of transaction processing, liquidity management, organizational structure, personnel and compliance on the nature of operational risk. Qualitative and quantitative measures of operational risk are discussed.
FRE 7801 Topics in Finance and Financial Markets I

1.5 Credits
Current topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide focus for further study. Examples might include Financial Economics, Macroeconomics and Finance, the Bond market, the securities markets, Derivatives markets, Contract Theory, Credit and Counterparty Risks, Banking Finance and others.

Prerequisite(s): Graduate standing and instructor's permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
- Other appropriate special topics courses, each being 1.5 credits

*Students may choose electives from the entire portfolio of FRE graduate courses and with their advisor's permission may choose courses from other departments of NYU-Poly or schools of NYU. These listed courses are suggestions.

Credit Allocation for Risk Finance track:

Core Courses: 15
Track Required Courses: 7.5
Laboratory Required: 1.5
Elective Credits: 6
Capstone: 3
Total Credits: 33

All these options require a review by faculty advisers and certification of satisfactory work.

Financial Engineering, Technology and Algorithmic Finance Track, M.S.

Requirements for the Master of Science

A Bachelor’s degree is required for admission to this program. It is expected that students will have superior mathematical talent. Students with degrees in other fields may be admitted, possibly with undergraduate deficiencies, at the discretion of departmental advisers. Before beginning graduate studies, conditionally approved students must demonstrate proficiency in basic statistics, probability and mathematics. The Department makes available refresher courses for this purpose and to serve the population of students who have been out of academia prior to matriculating into this program. Prerequisites: GRE exam scores (GMAT may be substituted, but GRE is strongly preferred), Calculus (MA 1124 or equivalent) Probability and Statistics (MA 2212 and MA 2222 or equivalent), and Linear Algebra (MA 2012 or equivalent).
Master's in Financial Engineering: 33 Credits

All tracks include in their program:

- 5 core courses, each 3 Credits
- Track required courses totaling 7.5 Credits
- 1 required applied lab, worth 1.5 Credits
- 4 elective courses, each 1.5 Credits
- 1 Capstone Experience of 3 Credits

All MS Financial Engineering students must also complete the Bloomberg Essentials Online Training Program to be qualified for graduation. The Department of Finance and Risk Engineering supports students’ efforts in this area by providing many Bloomberg terminals and laboratory assistants to answer student questions. This is a zero-credit requirement that is listed here as FRE 5500.

Core Courses (Required):

**FRE 6003 Financial Accounting**

3 Credits This course provides a solid foundation in the construction and interpretation of financial statements. Topics include accounting terminology; financial statement preparation and analysis; liquidity and credit risk ratios; depreciation calculations; revenue recognition; and accrued liabilities and asset valuation. Also covered are the effects of equity transactions; cash flows; and various accounting methods on financial statements.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6023 Economic Foundations in Finance**

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6103 Corporate Finance**

3 Credits The modern corporation, as issuer of financial securities and end-user of financial risk management products, is a major participant in financial markets and the economic counterpart to investors and financial intermediaries. The mechanism of financial markets and the valuation of instruments are studied in further detail in other courses. However, this course applies the tools of the trade of financial economics and corporate finance to the financial decision-making process of firms. Upon successful completion of this course, students know how to contribute to optimal financial decisions in a corporation: valuation; capital budgeting; risk; capital structure; dividend policy; long-term financing; risk management; and mergers and acquisitions. Increasingly important international factors that affect corporate finance are stressed throughout.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6123 Financial Risk Management and Asset Pricing**
This course introduces the techniques and problems of Financial Risk Management and Asset Pricing. It emphasizes risk finance and attitudes; Value at Risk; risk measurement principles; valuation and expected utility and their relevance in the valuation and the pricing of financial investments; insurance; management of derivatives; and risk management. Throughout, risk-management application problems are explored. The course introduces and focuses on the fundamental principles of the Arrow-Debreu state preference theory used to price derivatives and other assets in complete markets. Risk neutral-Binomial models in option pricing; essential elements of Ito calculus; and the Black-Scholes model for pricing options are introduced and applied to practical financial decision making and risk management problems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6083 Quantitative Methods in Finance

This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

Prerequisite(s): Students are expected to know calculus and elementary probability.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

* For Risk Finance the 6 credits comprising FRE 6003 and FRE 6083 are replaced by FRE 6021, FRE 6051, and FRE 6223.

All tracks: Core courses = 15 Credits.

Incoming MS students of Financial Engineering have four track options. Each track has required courses totaling 7.5 credits (except Risk Finance which requires 10.5 credits).

- Financial Markets and Corporate Finance
- Computational Finance
- Technology and Algorithmic Finance
- Risk Finance (Credit Risk, Financial Management and Insurance)

Required Labs per Track: 1.5 Credits

Students from all tracks must choose one of the following labs for 1.5 credits:

FRE 6811 Financial Software Laboratory

1.5 Credits This course teaches students to use financial software tools commonly employed in industry. Examples include: @Risk, Yieldbook, Excel, R, and C++.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6821 Financial Econometrics Laboratory
1.5 Credits This course teaches students to use financial econometrics software. Examples include: Eviews, Stata and others.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6831 Computational Finance Laboratory**

1.5 Credits This course teaches students to use the software tools employed in computational finance. Examples include: MATLAB, GAMS and other optimization software.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 6861 Financial Software Engineering**

1.5 Credits This financial lab requires students to publicly participate in a large software project. This participation could take the form of innovation, such as contributing to an open-source financial software project with the contributions being accepted and committed to the main branch, or invention, such as publishing a stand-alone library or package for a programming language commonly used in financial applications, or pure entrepreneurship, such as the development or updating of a brand-new industrial strength financial software application. As the students work on their project, this course will focus on important software engineering considerations specifically as they apply to the real-time world of financial projects, such as formalized procedures for revision control and bug tracking and other proven methods of software management in a fast-paced financial and business environment.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Required Certification: 0 Credits**

All students must complete the following certification:

**FRE 5500 Bloomberg Certification**

0 Credits The required Bloomberg certification is a self-taught, self-paced process available on any Bloomberg terminal. Upon completion and receipt of the certification, the student’s requirement in this area will be deemed complete. This requirement can be completed at any time prior to the end of the financial lab course, even before beginning the Master’s in Financial Engineering program if a student so chooses, but no later than the last class of the semester in which the lab course is taken.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Capstone Options: 3 Credits**

**FRE 9973 MS Thesis in Finance & Risk Engineering**

3 Credits In this research course, students undertake proprietary or non-proprietary research and write a thesis-type research paper. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within guidelines established by the supervising faculty member.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s
track and the nature of the thesis project.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7023 Financial Engineering Capstone: Internship

3 Credits In this course, the Career Management Center helps the student to secure an internship. Students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A paper based on the internship work is required. This course is graded on the S/U basis.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the internship.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7043 Financial Engineering Capstone: Project

3 Credits In this project course, students work with faculty on proprietary or non-proprietary research projects. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A significant written research component is required.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the project to be undertaken.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
- Two special topics courses at 1.5 credits each, with a capstone paper submitted to the faculty.

Technology and Algorithmic Finance Track

FRE 6151 Foundations of Financial Technology

1.5 Credits Every year, financial institutions spend billions to exploit the latest development in information technology. This course introduces a framework with which to understand and leverage information technology. The technology components covered include telecommunications, groupware, imaging and document processing, artificial intelligence and object-oriented analysis and design. The course also covers the entire technological-planning process specifically for financial institutions.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

and four of the following:

FRE 6041 Risk Management in the Real World

1.5 Credits The course covers failures of financial theory in risk management, deriving from fundamental definitions and assumptions in modeling, including pricing formulae; convexity; stochasticity and volatility; “fat tails”; and risk. Other topics: Portfolio robustness and extreme markets and moral hazard; datamining biases and decision error; and decision-making with incomplete information.
FRE 6131 Clearing and Settlement and Operational Risk

1.5 Credits This course focuses on issues involved in processing financial transactions—from order execution to final settlement of transactions—and operational risk in general. The course examines the procedures and market conventions for processing, verifying, and confirming completed transactions; resolving conflicts; decisions involved in developing clearing operations or purchasing clearing services; the role played by clearing houses; and numerous issues associated with cross-border transactions. The course also examines the effects of transaction processing, liquidity management, organizational structure, and personnel and compliance on the nature of operational risk. Qualitative and quantitative measures of operational risk are discussed.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6251 Numerical and Simulation Techniques in Finance

1.5 Credits The course presents advanced numerical techniques to solve ordinary, partial and stochastic differential equations. These techniques are analyzed mathematically and use computer aided software that allows for the solution and the handling of such problems. In addition, the course introduces techniques for Monte Carlo simulation techniques and their use to deal with theoretically complex financial products in a tractable and practical manner. Both self-writing of software as well as using outstanding computer programs routinely employed in financial and insurance industries will be used.

Prerequisite(s): FRE 6083.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6451 Behavioral Finance

1.5 Credits This course discusses investors’ systematic deviations from the level of financial rationality assumed by modern financial theory. Such biased behavior can lead to market inefficiencies, market opportunities and market failure. After a brief introduction to the topic and its research history, the course focuses on the limits to arbitrage created by decision bias, the equity premium puzzle, market over-reaction and under-reaction. The course seeks to understand how and where opportunities for and threats to wealth accumulation exist as a result of the mismatch between investor behavior and the assumptions about investment behavior inherent in financial theory.

Prerequisite(s): FRE 6023.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6511 Derivatives Algorithms

1.5 Credits This course focuses on the algorithms behind derivatives valuation and applications. The focus is on the principles and practice of financial engineering and risk management and on developing intuition: understanding the reasons for the existence of the product, simulating possible paths and possible parameter values as an exploratory process, approximating complex derivatives as a combination of simpler ones, and attempting to replicate the payout. The goal is to prepare students to be able to evaluate an arbitrary derivative given only its term sheet. to that end, the course requires a project almost every week. Projects can be done in any programming language (Excel, Mathematica, R, Python, etc.), but the final result must be stand-alone tables and graphs. The primary prerequisite is familiarity with standard option pricing and Greeks. A portion of the final exam may involve a live computation project.
Prerequisite(s): FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7211 Forensic Financial Technology and Regulatory Systems**

1.5 Credits The goal of this course is to understand the technology behind financial forensics and regulatory systems. These include innovative database techniques ("dataveillance"), artificial intelligence, data mining, and non-parametric outlier methods used by the Securities Exchange Commission (SEC), the Financial Industry Regulatory Authority (FINRA), as well as the FBI, and other federal and state agencies. Students will learn how to incorporate these technologies in the regulatory environment of the future. Student teams will prepare and present projects or case studies applying the concepts covered in class.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7221 Databases and Financial Information Technology**

1.5 Credits This is an advanced course on practical computer science topics most relevant to financial applications. As such it covers fundamental concepts such as database design, use, and maintenance, algorithmic complexity and efficiency considerations, memory optimization and grid performance, and, primarily, the use and importance of financial specification languages such as MDDL and FpML and financial communication standards such as FIX. Students will work on numerous projects, including attaining hands-on experience with a FIX engine.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7241 Algorithmic Portfolio Management**

1.5 Credits This course focuses on portfolio construction and rebalancing strategies such as momentum, value, and size strategies, among others. The course emphasizes back-testing and risk factor analysis as well as optimization to reduce tracking error. It will also address how a quantitative investment approach can help both individual and institutional investors make sound long-term investment decisions.

Prerequisite(s): FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**FRE 7251 Algorithmic Trading and High-Frequency Finance**

1.5 Credits Algorithmic trading refers to the utilization of special computer programs in an order management system that restructure an order into a sequence of sub-orders based on the dimensions of submission time, price, size, and side. The goal of this course is to survey several algorithmic strategies used by financial institutions and to understand their implementation in the context of order management systems and standard financial protocols (such as FIX and FIXatdl). Student teams will prepare and present projects or case studies applying the concepts covered in class.

Prerequisite(s): FRE 6151 and FRE 7221.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 7261 News Analytics and Strategies

1.5 Credits The fast-growing field of news analytics requires large databases, fast computation, and robust statistics. This course introduces the tools and techniques of analyzing news, how to quantify textual items based on, for example, positive or negative sentiment, relevance to each stock, and the amount of novelty in the content. Applications to trading strategies are discussed, including both absolute and relative return strategies, and risk management strategies. Students will be exposed to leading software in this cutting-edge space.

Prerequisite(s): FRE 6151 and FRE 7221.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Credit Allocation for Financial Markets and Corporate Finance, Computational Finance, and Financial Information Services and Technology tracks:

Core Courses: 15
Required Courses: 7.5
Elective Credits: 6
Lab: 1.5
Capstone: 3
Total Credits: 33

All these options require a review by faculty advisers and certification of satisfactory work.

History of Science and Technology, M.S.

Requirements for the Master of Science

Polytechnic is reinvigorating its MS degree in the history of science and technology by incorporating the expertise and courses of scholars at New York University's Washington Square campus. Please contact Prof. Myles W. Jackson (mjackson@poly.edu) for further information.

Industrial Engineering (Online), M.S.

Industrial Engineering

Industrial engineers are key professionals who explore how industrial systems work and spearhead effective and efficient delivery of quality products and services. In this online Master of Science in Industrial Engineering, students learn to exploit
Required Core Courses: 12 Credits

**IE 6113 Quality Control and Improvement**

*3 Credits* This course provides students with a solid foundation in the cost of quality, quality assurance and quality management. Emphasis is on the basic tools of quality control such as control charts and their use, the concept of “out of control,” acceptance sampling, variables and attributes charts and producer’s and consumer’s risk. A unique aspect of this course is the demonstration of the power of teams of people with different expertise to improve quality. A course project is required.

*Prerequisite(s):* MA 6513 or familiarity with the concepts of probability and statistics.
*Also listed under:* MN 6113.
*Note:* Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 6213 Facility Planning and Design**

*3 Credits* Topics in this course include facilities design for global competitiveness, strategic master site planning, site selection, factory layout and design, facility-management systems and materials handling and storage planning. Also presented are guidance on selecting alternative facility plans and application of queuing methods and computer modeling for facility design and evaluation.

*Note:* Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 6823 Factory Simulation**

*3 Credits* This course examines modeling and simulation of complex industrial, commercial and service systems, such as factories and hospitals. Students develop, run and test several simulation models using different software packages.

*Prerequisite(s):* Computer literacy.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7993 Supply Chain Engineering**

*3 Credits* Students in this course gain an understanding of how companies plan, source, make and deliver their products with a global competitive advantage. The course stresses the engineering components in developing an integrated supply chain that covers the entire manufacturing enterprise. It looks at the supply-chain infrastructure and the velocities of different models. The focus is on understanding and detecting the constraints of the infrastructure and the lowest common denominator of the information system used. Students also gain an understanding of logistical networks and the optimizing of the various traffic and location alternatives. Synchronization of supply and demand is examined in detail, looking at variability in both processes with the objective of maximizing throughput and capacity, emphasizing partnering, e-commerce and the bullwhip effect. Finally, the
course establishes global performance measurements that compare companies in different industries.

Also listed under: IE 7993.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Additional Requirements

- 9 Credits with Either IE or MN Designation
- Elective 9 credits (course selection optional)

Minimum Total: 30 Credits

Industrial Engineering, M.S.

Requirements for the Master of Science

The general Polytechnic requirements for the degree Master of Science are stated in this catalog under “Graduate Degrees and Advanced Certificates”. Detailed requirements for this degree are shown below.

Admission to the Master of Science program requires a bachelor’s degree in a related discipline from an accredited institution. Applicants should have a superior undergraduate academic record. Students who do not meet these requirements are considered individually for admission and may be admitted subject to their completion of courses to remove deficiencies. Students are encouraged to seek waivers (and have approved substitutes designated) for all required courses in which they can demonstrate competence, thereby using their time effectively.

Prerequisite Courses (or equivalent knowledge)

Students must have knowledge of engineering economics and probability and statistics. Prospective students lacking the relevant knowledge may satisfy the requirement by taking probability and statistics (MA 6513 or equivalent).

Up to 3 credits of graduate courses in this category of prerequisite knowledge can be counted toward the degree as electives, although the electives needed for the student’s concentration also must be satisfied.

Required Core Courses: 12 Credits

IE 6113 Quality Control and Improvement

3 Credits This course provides students with a solid foundation in the cost of quality, quality assurance and quality management. Emphasis is on the basic tools of quality control such as control charts and their use, the concept of “out of control,” acceptance sampling, variables and attributes charts and producer’s and consumer’s risk. A unique aspect of this course is the demonstration of the power of teams of people with different expertise to improve quality. A course project is required.
Prerequisite(s): MA 6513 or familiarity with the concepts of probability and statistics.
Also listed under: MN 6113.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6213 Facility Planning and Design

3 Credits Topics in this course include facilities design for global competitiveness, strategic master site planning, site selection, factory layout and design, facility-management systems and materials handling and storage planning. Also presented are guidance on selecting alternative facility plans and application of queuing methods and computer modeling for facility design and evaluation.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6823 Factory Simulation

3 Credits This course examines modeling and simulation of complex industrial, commercial and service systems, such as factories and hospitals. Students develop, run and test several simulation models using different software packages.

Prerequisite(s): Computer literacy.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 7893 Production Science

3 Credits This course reviews just-in-time and synchronous manufacturing methods. It analyzes the basic dynamics of factories to understand the importance of congestion and bottleneck rates on cycle time and inventories. Analytical models are developed to study variability and randomness introduced by breakdown, setups and batching. Simulation studies are used to provide data on performance of transfer lines.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Other Courses: 18 Credits

Students must take three electives from manufacturing or industrial engineering for a total of 9 credits.

Three electives are taken from any other graduate curriculum with the approval of the Program Director to ensure their compatibility with the student’s professional objectives for 9 credits.

Total: 30 Credits

Note:
Students should elect other courses in consultation with their adviser. Concentrations in areas suited to students’ career interest are encouraged (e.g., manufacturing, mechanical engineering, operations management, construction management and management of technology). Courses from computer science or management may supplement such a concentration.

**Information Management Executive (eIM), Information Management (IM) Concentration, M.S.**

**eIM Curriculum**

The eIM 36 credit curriculum consists of 24 credits of core courses and 12 credits of elective courses. To give students greater flexibility in choosing electives, the program has both full-semester courses that are 3.00 credits each and half-semester courses (marked with **) that are 1.50 credits each. Students may substitute one full-semester elective with two half-semester electives or vice-versa.

**Core Courses**

**First Semester**

**MG 6093 Accounting and Finance**

*3 Credits* The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6903 Managerial Decision Making for Information-Intensive Businesses**

*3 Credits* This course introduces managerial decision making and strategies, emphasizing information-intensive businesses and the fast-changing environment in which they compete. This course explores such issues as competing in both the digital and physical spaces, technology as an enabler of change, the role of the professional manager and managing in an increasingly globalized environment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8703 Introduction to Modern Information Technology Strategy**

*3 Credits* This course deals with applied competitive strategy. Students completing this course master a basic understanding of the competitive implications of information technology and the strategies for using information technology in business. This competence in analysis is arrived at through understanding how availability of information (through technology or otherwise) affects the basic strategic options available, and how firms and industries are likely to be affected. In addition, students are introduced to the process of evaluating potential systems innovations. They then are able to participate in strategic and systems
planning from a managerial point of view.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Second Semester

**MG 6083 Economics**

*3 Credits* The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6303 Operations Management**

*3 Credits* This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

*Also listed under: MN 6303.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Full-semester Elective

Third Semester

**MG 6073 Marketing**

*3 Credits* This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Full-semester Elective

**MG 9611 eIM Capstone-2**

*1.5 Credits* Second half of the eIM Capstone course. Please see MG 9603 eIM Capstone Project Course for full description. Both MG 9601 and MG 9611 courses may be taken in same semester.
Fourth Semester

**MG 8203 Project Management**

*3 Credits* This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses, Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

*Also listed under: CE 8203.*

**MG 9611 eIM Capstone-2**

*1.5 Credits* Second half of the eIM Capstone course. Please see MG 9603 eIM Capstone Project Course for full description. Both MG 9601 and MG 9611 courses may be taken in same semester.

**eIM Concentrations**

Elective courses are grouped into three different areas of interest referred to as concentrations:

- The Information Management (IM) business- driven base program concentration trains information-technology-based professionals to lead and oversee the process of invention, innovation, and entrepreneurship — what we call i2e.
- The Information Management (IMCIO) concentration allows information-technology professionals to develop their management and leadership skills with a focus on running IT as a business and receive certification from New York State (pending approval) as a CIO.
- The Information Management in Information Security and Privacy (IMCISO) concentration allows information-technology- based professionals to develop their management and leadership skills with a focus on cyber-security and receive certification from New York State* as a CISO.

**Note:**

* New York State CISO certification from Global Information Cyber Security Association

**Suggested Full-Semester Elective Courses Grouped by Concentration**
All full-semester elective courses are 3.00 credits. All eIM students may, with the written permission of the Program Director, substitute any of the following courses for any full-semester elective:

**MG 8573 Managing Cleantech and Renewable Energy Innovation**

*3 Credits* This course focuses on the rise of cleantech/renewable energy (aka sustainability green, etc.) as a possible major locus of Twenty-First-Century innovation. The course deals with the diverse ways innovation is taking pace in the broadly defined cleantech arena. The course covers technology management in several distinct cleantech/renewable technology regimes and varied company venues (e.g. small, medium size and large firms). The encompasses local and global modes of cleantech/renewable energy innovation. The course requires single-firm, multi-firm and “systems” perspectives for understanding with cleantech/renewable energy innovation. The course employs both intellectual and practitioner-oriented orientations. Throughout, this course maintains a primarily managerial perspective. Students are often asked to assume the role of managers charged with the responsibility of designing, supporting and implementing a cleantech/renewable energy innovation strategy. An overarching concern is on discovering ways to improve the effectiveness of cleantech/renewable energy innovation and technology management and, where appropriate, entrepreneurship.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8783 Managing Cloud Computing**

*3 Credits* Many corporations and governments around the world are either planning or are in the process of migrating into a “Cloud”. Cloud computing as a technology is proliferating at a rapid pace, and as such, there are myriad definitions, architectures, and models that are being developed. Cloud is a significant part of information management, and business managers should become well versed in managing and leading this cutting edge technology. They need to clearly understand how IT components such as virtualization, automation and security fit into and define a Cloud. This course provides a Comprehensive overview of managing cloud computing. The course starts by developing a comprehensive technology foundation and then deals with the economics of cloud computing by analyzing its benefits, risks and obstacles. The course then examines Virtualization, Automation, and Security, the three essential components of cloud computing. Specific case studies on private and public clouds are illustrated. The course concludes with the development of specific templates and roadmaps that help an organization migrate from managing traditional IT into a cloud based infrastructure.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9683 Internship and Action Learning**

*3 Credits* This course provides graduate students the opportunity to work in an organization relevant to their field of interest in an action-learning context under faculty supervision. It exposes graduate students to relevant, state-of-the-art and best practices in modern management from the perspective of reflective involvement and interaction in the field. Students submit a paper and oral presentation based on work accomplishments as well as a review of written evaluation by the onsite supervisor. This course may be taken only once.

**Prerequisite(s):** Approval of the Program Director

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Note:**

All eIM students may take full-semester electives from any of the following concentration areas:
Information Management (IM)

Second semester:

**MG 8753 Information Technology: Systems**

*3 Credits* This course prepares the student to be an educated consumer of information technology systems, thereby maximizing the strategic advantage of IT to an organization. Information technologies, architectures and products are categorized and analyzed with a view to develop and maintain the most favorable IT asset portfolio to carry out successfully business goals and strategies. Students learn techniques for making group decisions in assessing technology, outsourcing decisions, bidding on projects and negotiating contracts. Students also learn to manage a reliable, high-quality portfolio of information-technology systems, based on new insights into the relationship between the technology and business needs.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Third semester:

**MG 8763 Information Technology: Operations**

*3 Credits* This course covers IT operations and services. Students learn to deliver reliable, high-quality IT services through an automated, optimized IT infrastructure and operation, based on new insights into the relationship between those services and business needs. Topics covered: IT governance, data center automation, infrastructure optimization, service management, application performance management, and security management.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Fourth semester:

**MG 7743 Advanced Trends in Technology Management and Innovation**

*3 Credits* This course explores several emerging trends in the technology management and innovation arena in the past decade. These trends include the advent of digital-based innovation in the late 1990s, which has affected profoundly how many firms conduct business; the effect of the crash of the NASDAQ in March 2000 and the September 11 attack that affected corporations, which then had to operate within major economic and creative constraints; the development of the concept of networks as it relates to a firm’s organization and strategy; the development of the wireless technology platform and its effect on technology innovation; and the development of a new innovation paradigm that suggests a relationship between information technology, creativity and business practices. The course emphasizes classroom discussions and team-based and individual projects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Half Semester Elective Courses

All half-semester elective courses are 1.50 credits. All eIM students may take any of the following half-semester electives.

**MG 7841 Negotiation in Technology Intensive Sectors**

1.5 Credits Negotiation is the art and science of creating good agreements. This course covers the science of negotiation by discussing and applying theories of negotiation. The art of negotiation is learned by practice. Students develop the art by negotiating with each other in realistic cases. A wide variety of negotiation applications is covered, including one-time and repeated negotiation, single and multi-issue negotiations, and two-party and multiparty bargaining. The class emphasizes negotiations in technology-intensive environments. This class is taught using the case method. Many examples are cases that students negotiate with each other. Students’ grades are based on their performance in these negotiations and on class participation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7851 Leadership**

1.5 Credits Leaders set a vision, communicate it well and influence and inspire others to achieve their vision. However, leaders face many challenges in effectively meeting these objectives and can be aided or handicapped by effective and ineffective methods. This course develops the student’s leadership approach by analyzing individual styles, understanding their impact and then enabling each student to create the right leadership style. This course addresses fundamental leadership issues and frameworks, drawing on current organizational research, but most of all it provides students with ways of getting insights on their own leadership style. The course emphasizes hands-on experience and focuses on experiential learning. Course objectives include assessing leadership styles; developing leadership skills; and understanding the role of leadership coaching in managing teams.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7861 High-technology Entrepreneurship**

1.5 Credits This course focuses on entrepreneurship as a critical engine for wealth creation in the high-technology, innovation-intensive economy. It covers such key issues as: (1) assessing attractiveness of opportunities; (2) launching a new venture; (3) obtaining the necessary financial, human and technology resources; (4) managing the transition from a small entrepreneurial firm to a large, sustainable professionally managed but still entrepreneurial corporation; and (5) being an entrepreneur and promoting entrepreneurship in a large corporation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7871 Intellectual Property for Technology and Information Managers**

1.5 Credits This course focuses on the role of intellectual property (e.g., patents, trade secrets, copyrights and trademarks) as a major element in modern technology and information strategy. Relevant concepts and case studies are used, with examples representing classical and digital innovations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 7881 Modern Supply Chain Management: Integration Through Technology

1.5 Credits This course introduces the role of information technology in supply-chain management. Both qualitative and quantitative aspects of supply chain management are covered. Students discuss and analyze articles pertaining to leading-edge research and management thought. The underlying objective is to prepare participants to develop useful skills for analyzing technology, marketing, logistics, operations and broader channel management issues. Classes use the case method. A high level of class interaction is expected.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7891 Special Elective Topics for EMOT and EIM

1.5 Credits This course covers selected key emerging trends and issues in the MOT and IM domains. The course involves discussion with industry leaders and specialists from business, government and academia. The course includes topical treatment of technologies, markets, business practices, government regulations and the relationships among them.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7971 Financing for Value Creation

1.5 Credits This course focuses on creating strategies and financial skills required by managers of entrepreneurial and innovative firms at various stages of evolution: from new, stand-alone entrepreneurial ventures to innovative, technology driven projects of established corporations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9651 The Modern CIO: Challenges and Opportunities

1.5 Credits The Chief Information Officer (CIO) role has evolved from keeper of the infrastructure under the CFO, to an executive managing the organization’s information and sitting at the executive table. The CIO is the key strategic agent for the organizational use of technology and is the key agent in the creative-destructive process mediated by technology. Today technology is the single greatest factor in strategic change in a firm. The CIO is the executive best positioned to manage the creative-destructive power of technology and effect firm sustainability in the face of massive changes in markets. This course helps aspiring CIOs investigate this new and evolving role, using presentations, research and interviews of industry and public sector CIOs and CTOs as well as studying the market demands for CIOs and CTOs.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9691 The Modern Chief Information Security Officer: Challenges and Opportunities

1.5 Credits The role of Chief Cyber Security Officer or Chief Information Security Officer has evolved from securing computer systems under the CIO to an executive managing the organization’s information security and sitting at the executive table. The officer is a key strategic agent for the organizational use of cyberspace. The CISO has become the key player in the increasingly dangerous and insecure area of cyberspace, where firms must operate for maximum competitive advantage. The CISO is the executive best positioned to manage the security of the firm’s assets/infrastructure and operations in cyberspace. This course helps aspiring CISOs investigate this new and evolving role, using lectures, research, and interviews of industry and public sector CISOs, as well as by studying the market demands for CISO positions.
Information Management Executive (eIM), Information Management (IMCIO) Concentration, M.S.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9691 The Modern Chief Information Security Officer: Challenges and Opportunities**

1.5 Credits The role of Chief Cyber Security Officer or Chief Information Security Officer has evolved from securing computer systems under the CIO to an executive managing the organization’s information security and sitting at the executive table. The officer is a key strategic agent for the organizational use of cyberspace. The CISO has become the key player in the increasingly dangerous and insecure area of cyberspace, where firms must operate for maximum competitive advantage. The CISO is the executive best positioned to manage the security of the firm’s assets/infrastructure and operations in cyberspace. This course helps aspiring CISOs investigate this new and evolving role, using lectures, research, and interviews of industry and public sector CISOs, as well as by studying the market demand for CISO positions.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Information Management Executive (eIM), Information Management (IMCISO) Concentration, M.S.

eIM Curriculum

The eIM 36 credit curriculum consists of 24 credits of core courses and 12 credits of elective courses. To give students greater flexibility in choosing electives, the program has both full-semester courses that are 3.00 credits each and half-semester courses (marked with **) that are 1.50 credits each. Students may substitute one full-semester elective with two half-semester electives or vice-versa.

Core Courses

First Semester

**MG 6093 Accounting and Finance**

3 Credits The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6903 Managerial Decision Making for Information-Intensive Businesses**

3 Credits This course introduces managerial decision making and strategies, emphasizing information-intensive businesses and the fastchanging environment in which they compete. This course explores such issues as competing in both the digital and physical spaces, technology as an enabler of change, the role of the professional manager and managing in an increasingly globalized environment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8703 Introduction to Modern Information Technology Strategy**

3 Credits This course deals with applied competitive strategy. Students completing this course master a basic understanding of the competitive implications of information technology and the strategies for using information technology in business. This competence in analysis is arrived at through understanding how availability of information (through technology or otherwise) affects the basic strategic options available, and how firms and industries are likely to be affected. In addition, students are introduced to the process of evaluating potential systems innovations. They then are able to participate in strategic and systems planning from a managerial point of view.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Second Semester

**MG 6083 Economics**

*3 Credits* The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6303 Operations Management**

*3 Credits* This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
  * Full-semester Elective

Third Semester

**MG 6073 Marketing**

*3 Credits* This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
  * Full-semester Elective

**MG 9611 eIM Capstone-2**

*1.5 Credits* Second half of the eIM Capstone course. Please see MG 9603 eIM Capstone Project Course for full description. Both MG 9601 and MG 9611 courses may be taken in same semester.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
  * Half-semester Elective **
Fourth Semester

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Full-semester Elective

MG 9611 eIM Capstone-2

1.5 Credits Second half of the eIM Capstone course. Please see MG 9603 eIM Capstone Project Course for full description. Both MG 9601 and MG 9611 courses may be taken in same semester.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Half-semester Elective **

eIM Concentrations

Elective courses are grouped into three different areas of interest referred to as concentrations:

- The Information Management (IM) business-driven base program concentration trains information-technology-based professionals to lead and oversee the process of invention, innovation, and entrepreneurship — what we call i2e.
- The Information Management (IMCIO) concentration allows information-technology professionals to develop their management and leadership skills with a focus on running IT as a business and receive certification from New York State (pending approval) as a CIO.
- The Information Management in Information Security and Privacy (IMCISO) concentration allows information-technology-based professionals to develop their management and leadership skills with a focus on cyber-security and receive certification from New York State* as a CISO.

Note:

* New York State CISO certification from Global Information Cyber Security Association

Suggested Full-Semester Elective Courses Grouped by Concentration

All full-semester elective courses are 3.00 credits. All eIM students may, with the written permission of the Program Director, substitute any of the following courses for any full-semester elective:

MG 8573 Managing Cleantech and Renewable Energy Innovation
3 Credits This course focuses on the rise of cleantech/renewable energy (aka sustainability green, etc.) as a possible major locus of Twenty-First-Century innovation. The course deals with the diverse ways innovation is taking pace in the broadly defined cleantech arena. The course covers technology management in several distinct cleantech/renewable technology regimes and varied company venues (e.g. small, medium size and large firms). The encompasses local and global modes of cleantech/renewable energy innovation. The course requires single-firm, multi-firm and “systems” perspectives for understanding with cleantech/renewable energy innovation. The course employs both intellectual and practitioner-oriented orientations. Throughout, this course maintains a primarily managerial perspective. Students are often asked to assume the role of managers charged with the responsibility of designing, supporting and implementing a cleantech/renewable energy innovation strategy. An overarching concern is on discovering ways to improve the effectiveness of cleantech/renewable energy innovation and technology management and, where appropriate, entrepreneurship.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8783 Managing Cloud Computing

3 Credits Many corporations and governments around the world are either planning or are in the process of migrating into a “Cloud”. Cloud computing as a technology is proliferating at a rapid pace, and as such, there are myriad definitions, architectures, and models that are being developed. Cloud is a significant part of information management, and business managers should become well versed in managing and leading this cutting edge technology. They need to clearly understand how IT components such as virtualization, automation and security fit into and define a Cloud. This course provides a Comprehensive overview of managing cloud computing. The course starts by developing a comprehensive technology foundation and then deals with the economics of cloud computing by analyzing its benefits, risks and obstacles. The course then examines Virtualization, Automation, and Security, the three essential components of cloud computing. Specific case studies on private and public clouds are illustrated. The course concludes with the development of specific templates and roadmaps that help an organization migrate from managing traditional IT into a cloud based infrastructure.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9683 Internship and Action Learning

3 Credits This course provides graduate students the opportunity to work in an organization relevant to their field of interest in an action-learning context under faculty supervision. It exposes graduate students to relevant, state-of-the-art and best practices in modern management from the perspective of reflective involvement and interaction in the field. Students submit a paper and oral presentation based on work accomplishments as well as a review of written evaluation by the onsite supervisor. This course may be taken only once.

Prerequisite(s): Approval of the Program Director
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

All eIM students may take full-semester electives from any of the following concentration areas:

Information Management (IMCISO)

Second semester:
MG 8213 Information Security and Privacy for Managers

3 Credits This course addresses the principles of information security and privacy from a risk management perspective. Students learn why security is important to the enterprise and the potential impacts of security and privacy failures. Attacks will be discussed in terms of the goals of the attackers, their capabilities and the concept and high-level technical aspects of the attack’s operation. Each of the leading security controls is discussed in terms of the kinds of attacks it is meant to thwart, the concept of the defensive operations of both technologies and related processes, and management issues concerning the control.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Third semester:

MG 7883 Information Security and Privacy: Systems

3 Credits This course centers on management issues in information security and privacy in systems planning and development. Students learn to take a risk-based approach to integrating security into the planning and development of information systems at organization and enterprise levels. Topics covered: Risk analysis and management; integrating security into system design processes; security policies; legal, ethical, and privacy issues; and security in the software design process.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Fourth semester:

MG 8333 Information Security and Privacy: Operations

3 Credits This course focuses on management issues related to information security and privacy in operations. Students design security programs and processes that foster strong lifecycle security. Topics addressed include security organization structure, security program models, economics of security, security management of operations, incident response, contingency planning, compliance, security considerations of outsourcing and global operations, and security audits.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Half Semester Elective Courses

All half-semester elective courses are 1.50 credits. All eIM students may take any of the following half-semester electives.

MG 7841 Negotiation in Technology Intensive Sectors

1.5 Credits Negotiation is the art and science of creating good agreements. This course covers the science of negotiation by discussing and applying theories of negotiation. The art of negotiation is learned by practice. Students develop the art by negotiating with each other in realistic cases. A wide variety of negotiation applications is covered, including one-time and
repeated negotiation, single and multi-issue negotiations, and two-party and multiparty bargaining. The class emphasizes negotiations in technology-intensive environments. This class is taught using the case method. Many examples are cases that students negotiate with each other. Students' grades are based on their performance in these negotiations and on class participation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7851 Leadership

1.5 Credits Leaders set a vision, communicate it well and influence and inspire others to achieve their vision. However, leaders face many challenges in effectively meeting these objectives and can be aided or handicapped by effective and ineffective methods. This course develops the student’s leadership approach by analyzing individual styles, understanding their impact and then enabling each student to create the right leadership style. This course addresses fundamental leadership issues and frameworks, drawing on current organizational research, but most of all it provides students with ways of getting insights on their own leadership style. The course emphasizes hands-on experience and focuses on experiential learning. Course objectives include assessing leadership styles; developing leadership skills; and understanding the role of leadership coaching in managing teams.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7861 High-technology Entrepreneurship

1.5 Credits This course focuses on entrepreneurship as a critical engine for wealth creation in the high-technology, innovation-intensive economy. It covers such key issues as: (1) assessing attractiveness of opportunities; (2) launching a new venture; (3) obtaining the necessary financial, human and technology resources; (4) managing the transition from a small entrepreneurial firm to a large, sustainable professionally managed but still entrepreneurial corporation; and (5) being an entrepreneur and promoting entrepreneurship in a large corporation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7871 Intellectual Property for Technology and Information Managers

1.5 Credits This course focuses on the role of intellectual property (e.g., patents, trade secrets, copyrights and trademarks) as a major element in modern technology and information strategy. Relevant concepts and case studies are used, with examples representing classical and digital innovations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7881 Modern Supply Chain Management: Integration Through Technology

1.5 Credits This course introduces the role of information technology in supply-chain management. Both qualitative and quantitative aspects of supply chain management are covered. Students discuss and analyze articles pertaining to leading-edge research and management thought. The underlying objective is to prepare participants to develop useful skills for analyzing technology, marketing, logistics, operations and broader channel management issues. Classes use the case method. A high level of class interaction is expected.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 7891 Special Elective Topics for EMOT and EIM

1.5 Credits This course covers selected key emerging trends and issues in the MOT and IM domains. The course involves discussion with industry leaders and specialists from business, government and academia. The course includes topical treatment of technologies, markets, business practices, government regulations and the relationships among them.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7971 Financing for Value Creation

1.5 Credits This course focuses on creating strategies and financial skills required by managers of entrepreneurial and innovative firms at various stages of evolution: from new, stand-alone entrepreneurial ventures to innovative, technology driven projects of established corporations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9651 The Modern CIO: Challenges and Opportunities

1.5 Credits The Chief Information Officer (CIO) role has evolved from keeper of the infrastructure under the CFO, to an executive managing the organization’s information and sitting at the executive table. The CIO is the key strategic agent for the organizational use of technology and is the key agent in the creative-destructive process mediated by technology. Today technology is the single greatest factor in strategic change in a firm. The CIO is the executive best positioned to manage the creative-destructive power of technology and effect firm sustainability in the face of massive changes in markets. This course helps aspiring CIOs investigate this new and evolving role, using presentations, research and interviews of industry and public sector CIOs and CTOs as well as studying the market demands for CIOs and CTOs.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9691 The Modern Chief Information Security Officer: Challenges and Opportunities

1.5 Credits The role of Chief Cyber Security Officer or Chief Information Security Officer has evolved from securing computer systems under the CIO to an executive managing the organization’s information security and sitting at the executive table. The officer is a key strategic agent for the organizational use of cyberspace. The CISO has become the key player in the increasingly dangerous and insecure area of cyberspace, where firms must operate for maximum competitive advantage. The CISO is the executive best positioned to manage the security of the firm’s assets/infrastructure and operations in cyberspace. This course helps aspiring CISOs investigate this new and evolving role, using lectures, research, and interviews of industry and public sector CISOs, as well as by studying the market demand for CISO positions.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Information Systems Engineering, M.S.

Degree Requirements and Curriculum
The general requirements for a Master of Science, stated elsewhere in this catalog, apply to this program. The curriculum consists of 10 courses, including an optional independent project of 3 credits. The project must be completed by the end of second year and can begin as soon as the first semester.

Courses may change or new courses may be substituted to respond to changes in technology. The courses currently constituting the curriculum appear below:

Four software courses, typically from among:

**CS 6083 Principles of Database Systems**

3 Credits This course broadly introduces database systems, including the relational data model, query languages, database design, index and file structures, query processing and optimization, concurrency and recovery, transaction management and database design. Students acquire hands-on experience in working with database systems and in building web-accessible database applications.

Prerequisite(s): Graduate status, CS 6003 or equivalent, familiarity with basic data structures and operating system principles.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 9023 Web Technologies and Integrated Environments**

3 Credits Application Architecture in a three tier (web client, application server and data base server) environment is explained and analyzed. The impact of relevant open source tools (MySQL, CSS, AJAX etc. on the final application architecture is examined. Different integrated environments are contrasted. The content of this course is expected to change each semester as technology emerges.

Prerequisite(s): Graduate status.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 9033 Web Services and SOA**

3 Credits The service oriented architecture (SOA) is the latest application integration paradigm in the industry, developed to address the challenges of software development which anticipates the internal friction of interacting with incompatible architectures and programming models. SOA is a model of distributed software components which encapsulates business function in a reusable, composable way. SOA components, or services, are accessible using standardized protocols and are composed (or choreographed) into new applications using standard composition languages. The term “Web services” stands for a realization of the SOA paradigm as a set of XML based standards for component communication, description and composition. Middleware is software that allows different applications to interact on typically distributed computer systems.

Prerequisite(s): Graduate status.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 6063 Software Engineering I**

3 Credits The course emphasizes the full software-engineering approach with alternative approaches. Technical emphasis is on requirements, design, development and modeling. Management issues include software cost estimating and project management. Understanding the processes applicable to the software development/integration cycle and maintenance along with technology
changes on quality and development activities is highlighted.

Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

One systems course typically from among:

CS 6133 Computer Architecture I

3 Credits This course provides students with an understanding of computer-hardware subsystems, digital design strategies and fundamental computer-performance and capacity-improvement techniques. Combinational and sequential circuits are developed for the essential building blocks of computers. Binary number systems are presented in both human and computer algorithms. A uniprocessor computer is built from the blocks developed. An assembly language and an instruction set are presented. Processor implementation with a data path and hardwired and microprogrammed control is introduced. Performance evaluation of computers is studied. Basic pipelining is introduced to improve system performance. Memory-hierarchy alternatives are introduced to improve the capacity of the computing system.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6233 Introduction to Operating Systems

3 Credits This course introduces basic issues in operating systems. Topics: Threads, processes, concurrency, memory management, I/O Control and case studies.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

One networking course, typically from among:

CS 6823 Network Security

3 Credits This course begins by covering attacks and threats in computer networks, including network mapping, port scanning, sniffing, DoS, DDoS, reflection attacks, attacks on DNS and leveraging P2P deployments for attacks. The course continues with cryptography topics most relevant to securing networking protocols. Topics covered are block ciphers, stream ciphers, public key cryptography, RSA, Diffie Hellman, certification authorities, digital signatures and message integrity. After surveying basic cryptographic techniques, the course examines several secure networking protocols, including PGP, SSL, IPsec and wireless security protocols. The course examines operational security, including firewalls and intrusion-detection systems. Students read recent research papers on network security and participate in an important lab component that includes packet sniffing, network mapping, firewalls, SSL and IPsec.

Prerequisite(s): Graduate status and EL 5363 or CS 6843.
CS 6843 Computer Networking

3 Credits This course takes a top-down approach to computer networking. After an overview of computer networks and the Internet, the course covers the application layer, transport layer, network layer and link layers. Topics at the application layer include client-server architectures, P2P architectures, DNS and HTTP and Web applications. Topics at the transport layer include multiplexing, connectionless transport and UDP, principles of reliable data transfer, connection-oriented transport and TCP and TCP congestion control. Topics at the network layer include forwarding, router architecture, the IP protocol and routing protocols including OSPF and BGP. Topics at the link layer include multiple access protocols, ALOHA, CSMA/CD, Ethernet, CSMA/CA, wireless 802.11 networks and link layer switches. The course includes simple quantitative delay and throughput modeling, socket programming and network application development and Ethereal labs.

Prerequisite(s): Graduate status and CS 2134.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Management electives, not more than three, typically from the following:

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6303 Operations Management

3 Credits This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6013 Organizational Behavior

3 Credits Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and
development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6083 Economics**

3 Credits The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

A project course, CS 9963, is typically taken for the degree. The content and scope of the project is typically discussed with and approved by the Program Director. Electives are chosen in consultation with the Director.

**Integrated Digital Media, M.S.**

**Degree Requirements for the Master of Science**

The degree requires 30 credit hours of course work spread over three semesters. Students typically take a four-course load (at 3 credits per course) in the fall and spring of their first year. In the second year, students enroll in a 6-credit thesis seminar.

Distribution requirements for the degree mandate that all DM students enroll in their first year in a first-semester Media Studies Seminar (DM 6043) as well as Media Organizations (DM 6033) in the fall and Media Law Seminar (DM 7033) in the spring. The first-year seminar provides a dual role as a graduate-level course in media studies (complete with a writing-intensive research project) and a forum for students to present creative and technical work for peer review and group critique.

For the remainder of the coursework, the curriculum is:

**Fall:** Studio courses are offered in Performance, Sound, Cinema, 3D, Interaction Design, Game Design, Web and Networked Media. Students enroll in two of these courses their first semester, based on interest and the thesis project they are considering. Students will enroll in those courses they think will best raise their expertise level in a specialty for which they are well prepared. In addition, they collaborate with colleagues who have complementary skills and interests. While these studio courses are broad in scope (they cover a conceptual theme prevalent in digital media rather than a specific sub-topic), they each require focused production work on a final project.

**Spring:** Students may choose among three elective courses (“Specials”), which may include an Independent Study course (DM 9103) or a 3-credit Internship. “Special” electives, taught by regular and adjunct faculty, are selected each year from a group of possible courses based on the interests of the first-year class. For example, if the entering DM class is specifically interested in Machine Vision (based on its project work in the first-semester seminar), the faculty will “commission” an elective on that topic. Independent Study enrollment is permitted for DM students interested in specific research areas outside of the electives offered.
Internships are available for students seeking to gain job experience outside of NYU-Poly in the commercial or nonprofit sector. A final grade for the three credits of an Internship is determined by the faculty supervisor based on consultation with the host-firm internship supervisor, and students submit a 2,000-word report by the last day of the semester (last day of regular exams).

The third semester in the DM program centers on a 6-credit Thesis Seminar in which students develop MS thesis projects and write in a group environment supervised by a faculty member. At the end of the seminar, students prepare and defend their thesis projects before a faculty committee. After a successful thesis defense, students deposit their thesis papers with NYU-Poly and receive their degrees.

**Management of Technology, M.S.**

**Program Structure and Curriculum**

The MOT Program comprises 12 courses (see listing below) for 36 credits. Courses for the MOT program are held during the evening at 55 Broad Street in Lower Manhattan and at the Brooklyn campus of Polytechnic. Fulltime students may complete this MS program in 10 calendar months by completing 4 courses per semester for 3 semesters or in 15 calendar months by completing 3 courses per semester for 4 semesters. Part-time students may take from one to two courses per semester, completing the program in 22 to 44 calendar months. Participants in the MOT Program receive a Master of Science in Management of Technology. The MOT Program is also offered in Executive format; please refer to the Management of Technology Executive Master’s Program catalog pages. For most current information, visit http://www.poly.edu/amot

The MOT program’s series of required courses provide participants with a deep understanding of the foundations of managerial competencies needed to manage innovation in the evolving business environment. In addition, participants can choose an elective from the Department of Technology Management or from other areas of the Institute that can enhance their understanding of a particular area of interest in the broadly defined arena of technology management.

**Required Courses**

**MG 6093 Accounting and Finance**

*3 Credits* The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8653 Managing Technological Change and Innovation**

*3 Credits* This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.
Also listed under: MN 8653.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6013 Organizational Behavior

3 Credits Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6503 Management of Information Technology and Information Systems

3 Credits This course is for managers who need to understand the role and potential contribution of information technologies in organizations. The course focuses on different information technologies and their applications in managing business-critical data, information and knowledge. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process re-engineering, knowledge management and group support systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6083 Economics

3 Credits The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6303 Operations Management

3 Credits This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6073 Marketing

3 Credits This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.

MG 7953 Global Innovation

3 Credits This course focuses on global technology-enabled innovation. Topics covered include accessing global sources of innovation, coordination and organization of activities worldwide, new product development globally, the role of revitalized global R&D, growing prominence of IT and e-Business in global innovation and the role of alliances and linkages with customers, suppliers and other third parties.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

MG 997X MS Thesis in Technology Management

3 Credits Students choose original investigation topics for their theses. While they conduct research and draft their theses, students are required to confer with their advisers and to submit progress reports. A final written report is required at completion. The department may request an oral examination.

Prerequisite(s): Degree status and approval of supervising professor, MSM Program Director and TM department chair.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

- Elective 1 **
- Elective 2 **

Footnotes

* To fulfill a requirement for a technology-related course, participants can substitute other courses given by the Department of Technology Management in this field, e.g., MG 6603 Management of New and Emerging Technologies; MG 7503 Electronic Business Management; or another technology-related course with permission of the Program Director.
** MOT Electives include any 3.0 credit graduate course offered by the Department of Technology Management, including MG 9683 Internship and Action Learning. With the MOT Program Director’s permission, MOT students also may choose an elective 3.0 credit graduate courses offered by another NYU-Poly department.

Management, Construction Management Concentration, M.S.

The MS Management Curriculum

1. Core Courses

The six required core courses shown below provide an 18 credit foundation upon which students can pursue cutting-edge specializations within the degree program. These core courses expose students to the disciplines required of a professional manager. Students who have taken these courses elsewhere or previously at NYU-Poly, or who have had equivalent experience, may apply to substitute elective courses for such core courses; however, all students are required to complete the MSM degree’s 36 credits.

**MG 6013 Organizational Behavior**

*3 Credits* Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

*Note:* Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6073 Marketing**

*3 Credits* This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6083 Economics**

*3 Credits* The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.
MG 6093 Accounting and Finance

3 Credits The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6503 Management of Information Technology and Information Systems

3 Credits This course is for managers who need to understand the role and potential contribution of information technologies in organizations. The course focuses on different information technologies and their applications in managing business-critical data, information and knowledge. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process re-engineering, knowledge management and group support systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8673 Technology Strategy

3 Credits This course examines in-depth the strategic technological decisions that a general manager faces. From entrepreneurial start-ups to established companies, in dynamic as well as mature environments, a firm must create a conscious process of formulating and implementing a technology strategy to serve its business interests. Such a strategy guides investments in research and development, selection among and timing of alternate technologies, organization and communications, formation of alliances and funding of ventures.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:
Core courses should be taken as early in the program as possible.

2. Areas of Concentration

Students must formally choose and declare a 15 credit area of concentration, which can be from among those listed below or, with the MSM Program Director’s pre-approval, a set of courses that meet individual needs through a custom MSM concentration. A minimum of four courses must be selected in any one concentration area. Courses in all the available concentrations are shown below.

3. Capstone Project Course

This required, integrating three-credit course, MG 9703 Project in Strategy and Innovation, is recommended for a student’s final semester. In special cases, MG 997X MS Thesis in Technology Management may be substituted for students wishing to produce
a major dissertation in a specialty with the permission of the MSM Program Director and the TM Chair. Such a student must follow the Master’s Thesis course requirements.

Concentration Course Requirements

Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

Construction Management

The Concentration in Construction Management enables engineers and other construction-industry professionals to understand relevant managerial and physical, infrastructural-technological developments. The concentration also helps students become effective and innovative by integrating construction and management.

Required:

**MG 6303 Operations Management**

*3 Credits* This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

*Also listed under: MN 6303.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8203 Project Management**

*3 Credits* This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

*Also listed under: CE 8203.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Select Three:

**CE 8243 Construction Modeling Techniques**

*3 Credits* This course deals with various construction-modeling techniques, including the development of two-dimensional (2D) and three-dimensional (3D) design documents. Students are introduced to the development of building information models (BIM)
and their associated databases, using state-of-the-art design and management systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8253 Project Management for Construction**

*3 Credits* This course covers topics specific to developing and coordinating large projects, including organizational structures, management functions, pricing and estimating project costs, bidding and contracting, risk allocation, scheduling, time and cost control, labor relations, quality management and project life-cycle activities.

*Also listed under: MG 8253.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
or

*Also listed under: CE 8263.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8273 Contracts and Specifications**

*3 Credits* This course covers principles of contract law as applied to the construction industry and legal problems in preparing and administering construction contracts.

*Also listed under: MG 8273.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 8273 Contracts and Specifications

3 Credits This course covers principles of contract law as applied to the construction industry and legal problems in preparing and administering construction contracts.

Also listed under: CE 8273
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8353 Construction Scheduling

3 Credits Students will be instructed in advanced Critical Path Method (CPM) construction scheduling techniques including the use of Primavera Project Planner v. 7.0. The course will cover Precedence Diagramming Method (PDM), project resources and resource leveling, schedule updating, schedule impacts of date constraints, project time and cost trade-offs, activity duration estimating, work breakdown structures, differing scheduling requirements on different types of construction projects and an overview of construction contract scheduling specifications. An introduction to other scheduling methodologies and the use of schedules in construction claims will also be addressed.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

** For complete Construction Management course descriptions please see course listings in the NYU-Poly Catalog section of the Construction Management Program. Registration may require permission from a Construction Management adviser.

Such a student must follow the Master’s Thesis course requirements.

Concentration Course Requirements

Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

Electronic Business

The Electronic Business Management Concentration focuses on the arena of electronic business and the Internet. Students study the process of digital-intensive market creation and the key aspects for managing a firm that operates increasingly in digital space. Relevant methods and concepts for effective electronic business decision making are explored and applied.

Required:

MG 7173 Enterprise Data Systems

3 Credits The course addresses modern issues of large-scale information and knowledge management through the design, development and implementation of different kinds of database technologies. The course introduces and elaborates data modeling through relational models, SQL applications, database architecture, different types of database-management systems, and data integrity and administration. The course introduces emerging database technologies, such as distributed Internet-based databases, distributed client/server databases, multidimensional databases, groupware, data warehousing, and data mining for decision
support.

Concentration Course Requirements

Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

Entrepreneurship

The Entrepreneurship Concentration is offered for the manager, professional or specialist interested in entrepreneurial management—as an entrepreneur starting a new business, as an “intrapreneur” in a large, established firm, or as a professional (e.g., venture capitalist) interested in playing a role in new enterprises. This concentration develops a valuable entrepreneurial state of mind for any business setting. Modern entrepreneurial concepts and cases are learned and applied.

Required:

MG 7703 Entrepreneurship

3 Credits This course focuses on entrepreneurship and venture creation as key engines for wealth creation and successful business strategy in the modern, innovation-intensive, high-tech economy. The course deals with key issues such as: (1) assessing attractiveness of opportunities; (2) launching a new venture; (3) nurturing, growing and entrepreneurial venture; (4) obtaining the necessary financial, human and technology resources; (5) managing the transition from a small entrepreneurial firm to a large, sustainable, professionally managed but still entrepreneurial corporation; and (6) being an entrepreneur and promoting entrepreneurship in a large corporation.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8653 Managing Technological Change and Innovation

3 Credits This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

Also listed under: MN 8653.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Select Two:

- MG 7733 Managing Intellectual Property and Intellectual Capital

MG 8713 Entrepreneurial Finance

3 Credits This course focuses on the financial requirements of entrepreneurial ventures and on different sources of finance available to entrepreneurs. The course develops an understanding on how to assess various entrepreneurial financial strategies. The course also examines the unique roles in the entrepreneurial finance arena of such factors as retail banks, investment banks, VCs, angels, internal sources of capital, and incubators.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8723 Managing Growing Enterprises

3 Credits This course deals with a critical challenge that potentially confronts all successful entrepreneurial small or medium-size firms: how to sustain and accelerate major growth. At some point in the life of all growing enterprises, a firm usually must change. The firm no longer can operate on a scale that is small, possibly ad hoc and overly responsive. to adapt, the firm needs to exploit successfully its success in the marketplace and the future attractiveness of its innovative products and services. This course examines how a growing firm can transform itself from a smaller to a larger enterprise. The course focuses particularly on how companies can maintain the benefits of an entrepreneurial commitment and spirit while still obtaining needed skills associated with professionally managed larger firms. In this way, fast-growing firms can take advantage of innovation-based opportunities while scaling up.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8743 Entrepreneurial Marketing and Sales

3 Credits This course focuses on critical marketing and sales challenges facing entrepreneurial firms. The course examines an underlying theme of entrepreneurship: that successful innovative enterprises must deeply understand relevant markets and must effectively cultivate and reach those markets. Topics include market identification, segmentation, sales, overall market planning, niche and viral marketing, and customers as sources of innovative ideas.

Concentration Course Requirements

Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

Human Resource Management
The Concentration in Human Resource Management prepares professionals for today’s technology-intensive environment. The program provides the knowledge and techniques to deal with human-resource issues and to achieve high-quality innovation and productivity in often-turbulent organizational settings. The changing nature of work and shifting professional expectations are explored.

Required:

**MG 6123 Human Resource Management**

*3 Credits* This course introduces the broad range of human resource functions and their organizational role. It addresses issues in managing people that have an impact not only on HR professionals but also on line managers. The course is divided into four modules: (1) an overview of HRM from a strategic perspective; (2) the management of human resources, including recruitment and selection, performance management, compensation and benefits, training and career support; (3) human resource challenges, including diversity, procedural justice and ethics, collective bargaining and managing change and innovation; and (4) professional roles in HRM.

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6073 Marketing**

*3 Credits* This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6083 Economics**
3 Credits The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6093 Accounting and Finance

3 Credits The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6503 Management of Information Technology and Information Systems

3 Credits This course is for managers who need to understand the role and potential contribution of information technologies in organizations. The course focuses on different information technologies and their applications in managing business-critical data, information and knowledge. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process re-engineering, knowledge management and group support systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8673 Technology Strategy

3 Credits This course examines in depth the strategic technological decisions that a general manager faces. From entrepreneurial start-ups to established companies, in dynamic as well as mature environments, a firm must create a conscious process of formulating and implementing a technology strategy to serve its business interests. Such a strategy guides investments in research and development, selection among and timing of alternate technologies, organization and communications, formation of alliances and funding of ventures.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

Core courses should be taken as early in the program as possible.

2. Areas of Concentration

Students must formally choose and declare a 15 credit area of concentration, which can be from among those listed below or, with the MSM Program Director’s pre-approval, a set of courses that meet individual needs through a custom MSM concentration. A minimum of four courses must be selected in any one concentration area. Courses in all the available concentrations are shown below.
3. Capstone Project Course

This required, integrating three-credit course, MG 9703 Project in Strategy and Innovation, is recommended for a student’s final semester. In special cases, MG 997X MS Thesis in Technology Management may be substituted for students wishing to produce a major dissertation in a specialty with the permission of the MSM Program Director and the TM Chair. Such a student must follow the Master’s Thesis course requirements.

Concentration Course Requirements

Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

Information Management and Telecommunications Management

The Concentration in Information Management and Telecommunications Management is for professionals in information technology (IT), telecom and networking, programmers, systems experts and others with IT-related career goals and experience. Students learn to understand how IT and networking enhance the effectiveness of modern firms and the ability to manage creative and professional people.

Required:

MG 6553 Telecommunications Management I

*3 Credits* This course introduces the fundamentals of modern telecommunications and networking for current and future managers. Topics include basic concepts such as components of data communication, data transmission, Open System Interconnection (OSI), TCP/IP and other models, data link and network layers and local area networks (LANs). The course expands technical knowledge and discusses related managerial issues.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7173 Enterprise Data Systems

*3 Credits* The course addresses modern issues of large-scale information and knowledge management through the design, development and implementation of different kinds of database technologies. The course introduces and elaborates data modeling through relational models, SQL applications, database architecture, different types of database-management systems, and data integrity and administration. The course introduces emerging database technologies, such as distributed Internet-based databases, distributed client/server databases, multidimensional databases, groupware, data warehousing, and data mining for decision support.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Select Three:

Select three 3-credit courses of interest (for nine credits) with an “MG” or “FRE*” prefix.
Management, Project Management Concentration, M.S.

The MS Management Curriculum

1. Core Courses

The six required core courses shown below provide an 18 credit foundation upon which students can pursue cutting-edge specializations within the degree program. These core courses expose students to the disciplines required of a professional manager. Students who have taken these courses elsewhere or previously at NYU-Poly, or who have had equivalent experience, may apply to substitute elective courses for such core courses; however, all students are required to complete the MSM degree’s 36 credits.

MG 6013 Organizational Behavior

3 Credits Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6073 Marketing

3 Credits This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6083 Economics

3 Credits The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6093 Accounting and Finance
3 Credits The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Such a student must follow the Master’s Thesis course requirements.

Concentration Course Requirements
Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

Project Management

The Concentration in Project Management is for managers who manage, finance or facilitate projects in modern enterprises. This concentration provides managers with the latest managerial knowledge and methods to manage an array of projects effectively.

Required:

MG 6303 Operations Management

*3 Credits* This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

*Also listed under: MN 6303.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8203 Project Management

*3 Credits* This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses, Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

*Also listed under: CE 8203.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Such a student must follow the Master’s Thesis course requirements.

**Concentration Course Requirements**

Each MSM concentration sequence comprises a minimum of five courses totaling 15 credits. Substitutions may be made with the MSM Program Director’s pre-approval in any concentration area.

**Technology Management**

The Technology Management Concentration is for managers, engineers and other professionals in technology-intensive environments and for those involved with technology-intensive products, processes or services. The program provides the modern methods and concepts necessary to make strategic technology-investment decisions; to understand technology and innovation strategy, product-life cycles and competitive factors; and to develop special skills need to manage creative people and professionals.
Required:

**MG 8203 Project Management**

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

*Also listed under: CE 8203.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8653 Managing Technological Change and Innovation**

3 Credits This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

*Also listed under: MN 8653.*

**Select Three:**

Select three 3-credit courses of interest (for nine credits) with an “MG” or “FRE*” prefix.

**Note:**

* FRE courses may require pre-approval from the FRE Department.

**Manufacturing Engineering (Online), M.S.**

**Manufacturing Engineering**

Global competition for manufacturing productivity and profitability has generated vast new frontiers, introducing new, innovative strategies, tools and technologies. Manufacturing engineers are at the forefront of inventive ways to improve quality, reduce inventory, and curtail cycle time by focusing on design and product-realization processes. Graduates of this online Master of Science in Manufacturing Engineering implement effective manufacturing methods, such as Total Quality Management, Just-In-
Time Manufacturing and Total Quality Control. Students emerge as experts in new production-control systems, lean manufacturing and activity-based costing.

Required Core Courses: 12 Credits

**MN 7893 Production Science**

3 Credits This course reviews just-in-time and synchronous manufacturing methods. It analyzes the basic dynamics of factories to understand the importance of congestion and bottleneck rates on cycle time and inventories. Analytical models are developed to study variability and randomness introduced by breakdown, setups and batching. Simulation studies are used to provide data on performance of transfer lines.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 6113 Quality Control and Improvement**

3 Credits This course provides students with a solid foundation in the cost of quality, quality assurance and quality management. Emphasis is placed on the basic tools of quality control such as control charts and their use, the concept of “out of control,” acceptance sampling, variables and attributes charts, and producer’s and consumer’s risk. This course uniquely demonstrates the power of teams of people with different expertise to improve quality. A course project is required.

Prerequisite(s): MA 6513 or equivalent.
Also listed under: IE 6113.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7923 Design for Manufacturability**

3 Credits This course introduces concepts and techniques for economical, functionally sound and high-quality product design for manufacture. The emphasis is on designing for easy robotic and manual assembly, and on using plastics effectively to reduce manufacturing costs. Managerial and organizational approaches and case studies of successful designs are reviewed.

Also listed under: IE 7923.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7993 Supply Chain Engineering**

3 Credits Students in this course gain an understanding of how companies plan, source, make and deliver their products with a global competitive advantage. The course stresses the engineering components in developing an integrated supply chain that covers the entire manufacturing enterprise. It looks at the supply-chain infrastructure and the velocities of different models. The focus is on understanding and detecting the constraints of the infrastructure and the lowest common denominator of the information system used. Students also gain an understanding of logistical networks and the optimizing of the various traffic and location alternatives. Synchronization of supply and demand is examined in detail, looking at variability in both processes with the objective of maximizing throughput and capacity, emphasizing partnering, e-commerce and the bullwhip effect. Finally, the course establishes global performance measurements that compare companies in different industries.
Also listed under: IE 7993.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

9 Credits with Either IE or MN Designation

Elective 9 credits (course selection optional)

Minimum Total: 30 Credits

Manufacturing Engineering, M.S.

Graduate Program

The Master of Science in Manufacturing Engineering can be taken full time or part time. Students are drawn from a wide variety of manufacturing firms, large and small. This program:

- Enables graduates to identify, evaluate and implement production improvements by applying new methods;
- Provides experience in design and production through internships and projects;
- Provides hands-on experience in using software for design and simulation;
- Equips program graduates with a working knowledge of advanced methods and techniques used worldwide in manufacturing;
- Provides graduates with sufficient knowledge and hands-on experience to contribute significantly to productivity improvement and to provide the leadership required, thereby positioning them to advance their careers.

Desirable Backgrounds for Graduate Students

Admission to this graduate program is open to those holding an accredited engineering degree (BS or BE), to graduates in physics, chemistry, materials science and the biological sciences, and to those holding an MBA. International students with equivalent backgrounds are eligible for the program.

Requirements for the Master of Science

The degree program requires 30 credits, 9 of which may be granted for up to three relevant graduate-level courses completed elsewhere with a grade of B or better. Issues relating to the transfer of courses are at the discretion of the Program Director.

Manufacturing Engineering Program
Prerequisite Courses (or equivalent knowledge)

- Computer literacy
- Knowledge of engineering economics
- Understanding of probability and statistics

Students lacking the relevant knowledge must complete additional courses to satisfy these prerequisites.

Required Core Courses: 12 Credits

**MN 7893 Production Science**

*3 Credits* This course reviews just-in-time and synchronous manufacturing methods. It analyzes the basic dynamics of factories to understand the importance of congestion and bottleneck rates on cycle time and inventories. Analytical models are developed to study variability and randomness introduced by breakdown, setups and batching. Simulation studies are used to provide data on performance of transfer lines.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 6113 Quality Control and Improvement**

*3 Credits* This course provides students with a solid foundation in the cost of quality, quality assurance and quality management. Emphasis is placed on the basic tools of quality control such as control charts and their use, the concept of “out of control,” acceptance sampling, variables and attributes charts, and producer’s and consumer’s risk. This course uniquely demonstrates the power of teams of people with different expertise to improve quality. A course project is required.

Prerequisite(s): MA 6513 or equivalent.
Also listed under: IE 6113.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7923 Design for Manufacturability**

*3 Credits* This course introduces concepts and techniques for economical, functionally sound and high-quality product design for manufacture. The emphasis is on designing for easy robotic and manual assembly, and on using plastics effectively to reduce manufacturing costs. Managerial and organizational approaches and case studies of successful designs are reviewed.

Also listed under: IE 7923.
Note: Online version available.

**MN 7993 Supply Chain Engineering**

*3 Credits* Students in this course gain an understanding of how companies plan, source, make and deliver their products with a global competitive advantage. The course stresses the engineering components in developing an integrated supply chain that covers the entire manufacturing enterprise. It looks at the supply-chain infrastructure and the velocities of different models. The focus is on understanding and detecting the constraints of the infrastructure and the lowest common denominator of the
information system used. Students also gain an understanding of logistical networks and the optimizing of the various traffic and location alternatives. Synchronization of supply and demand is examined in detail, looking at variability in both processes with the objective of maximizing throughput and capacity, emphasizing partnering, e-commerce and the bullwhip effect. Finally, the course establishes global performance measurements that compare companies in different industries.

Also listed under: IE 7993.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Other Courses: 18 Credits

Students are required to take three electives from Manufacturing or Industrial Engineering for a total of 9 credits.

Three electives are taken from any other graduate curriculum with the approval of the Program Director to ensure that they are compatible with the student’s professional objectives for a total of 9 credits.

Total: 30 Credits

Students are encouraged to organize their electives into “concentrations.” These concentrations satisfy the needs of students’ careers and, for those who are working, the needs of the firm.

Master's Report

MN 9963 MS Report I is normally 3 credits and may be expanded to 6 credits by using MN 9973 as an elective. The master’s report is done in an industrial lab setting whenever possible. Local industries with plants accessible to campus offer internships in many types of manufacturing.

Part-time students may draw upon their work to provide pertinent master’s reports. Full-time students also may work on theoretical or experimental research projects at Polytechnic. In all cases, a faculty adviser is assigned. Written project proposals are required at the start of the work. A written summary and report are required upon completion of the project.

Mathematics, Examination Option and Designated Sub-specialty Option, M.S.

Requirements for the Master of Science

Bachelor’s degrees in mathematics are required for admission to this program. Students with degrees in other fields may be admitted, possibly with undergraduate deficiencies, at the discretion of departmental advisers. Before beginning graduate studies, students are expected to have completed a one-year course in advanced calculus.

Thirty credits are required. Six credits may be devoted to a thesis.

Required (core) courses, 12 credits, 3 credits each:

MA 7033 Linear Algebra I
This course covers: Basic ideas of linear algebra: Fields, vector spaces, basis, dependence, independence, dimension.
Relation to solving systems of linear equations and matrices. Homomorphisms, duality, inner products, adjoints and similarity.

Prerequisite(s): MA 2012 and MA 2122 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7043 Linear Algebra II

This course continues MA 7033. Topics covered: Basic concepts of linear algebra continuing with: Range, nullity, determinants and eigenvalues of matrices and linear homomorphisms, the polar decomposition and spectral properties of linear maps, orthogonality, adjointness and its applications.

Prerequisite(s): MA 7033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6213 Elements of Real Analysis I

This course and its sequel MA 6223 rigorously treat the basic concepts and results in real analysis. Course topics include limits of sequences, topological concepts of sets for real numbers, properties of continuous functions and differentiable functions. Important concepts and theorems include supremum and infimum, Bolzano-Weierstrass theorem, Cauchy sequences, open sets, closed sets, compact sets, topological characterization of continuity, intermediate value theorem, uniform continuity, mean value theorems and inverse function theorem.

Prerequisite(s): MA 2122 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6223 Elements of Real Analysis II

This course continues MA 6213. The topics are integration, series of real numbers, sequences and series of functions and Fourier series. Important concepts and theorems include Riemann and Riemann-Stieltjes integral, fundamental theorem of calculus, the mean value theorem of integrals, Dirichlet test, absolute and conditional convergence, uniform convergence, Weierstrass test, power series, orthogonal functions and Fourier series.

Prerequisite(s): MA 6213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

All Options:

Minimum of 15 credits (total) in mathematics courses.

There are three options for incoming MS students of Mathematics:

By Examination Option + Designated Sub-specialty Option:

Elective: 18 credits. At least 9 credits in courses approved for specialization by Department.

Note:
Includes a comprehensive oral examination before the degree is awarded. Examinations cover the student’s program of study and are scheduled towards the end of the semester in which the work is completed.

Total: 30 Credits

Mathematics, Examination Option, M.S.

Requirements for the Master of Science

Bachelor’s degrees in mathematics are required for admission to this program. Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6213 Elements of Real Analysis I

3 Credits This course and its sequel MA 6223 rigorously treat the basic concepts and results in real analysis. Course topics include limits of sequences, topological concepts of sets for real numbers, properties of continuous functions and differentiable functions. Important concepts and theorems include supremum and infimum, Bolzano-Weierstrass theorem, Cauchy sequences, open sets, closed sets, compact sets, topological characterization of continuity, intermediate value theorem, uniform continuity, mean value theorems and inverse function theorem.

Prerequisite(s): MA 2122 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6223 Elements of Real Analysis II

3 Credits This course continues MA 6213. The topics are integration, series of real numbers, sequences and series of functions and Fourier series. Important concepts and theorems include Riemann and Riemann-Stieltjes integral, fundamental theorem of calculus, the mean value theorem of integrals, Dirichlet test, absolute and conditional convergence, uniform convergence, Weierstrass test, power series, orthogonal functions and Fourier series.

Prerequisite(s): MA 6213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

All Options:

Minimum of 15 credits (total) in mathematics courses.

There are three options for incoming MS students of Mathematics:

Thesis Option:

Electives: 12 credits
Master’s Thesis: 6 credits
Note:

Requires an examination of the thesis material by faculty advisers and certification that the work is satisfactory.

Total: 30 Credits

Mechanical Engineering, Controls and Dynamic Systems Specialty, M.S.

Requirements for the Master of Science

Course requirements for the MS in Mechanical Engineering are suited to the applicant’s specialty, which is specified by the student in the admissions process or during the first advising session. Students must take at least 21 credits out of the 30 credits needed for the degree at Polytechnic. No more than 6 credits in “Guided Reading” courses are allowed. Validation credit is not allowed, but the graduate adviser may waive specific requirements (and substitute designated ones), based upon the student’s prior studies or experience. Transfer credits are not granted for:

- undergraduate courses;
- courses counted toward satisfying undergraduate degree requirements;
- courses not related to the graduate program as stated in this catalog;
- courses that received a grade lower than B.

Studies for the MS must be completed in five years, unless a formal leave of absence is approved before the period for which studies are interrupted.

The degree requirements are:

**ME 6003 Applied Mathematics in Mechanical Engineering**

*Prerequisite(s): Adviser approval.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 6043 Transport Phenomena**

*Prerequisite(s): Adviser approval.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
**ME 6213 Introduction to Solid Mechanics**

*3 Credits* The course explores fundamentals of kinematics of solid bodies; displacement and strain measures, introduction to statics of solid bodies, stress tensor, equilibrium equations. Topics include analysis of columns, beams and beams on elastic foundations.

*Prerequisite(s): Adviser approval.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 6603 Digital Control Systems**

*3 Credits* The course introduces digital systems, signal conversion techniques, z-transform and inverse z-transform, transfer function and block diagrams, state-variable techniques, controllability, observability, stability and control design techniques.

*Prerequisite(s): Adviser approval.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

**ME 6703 Linear Control Theory and Design I**

*3 Credits* The course covers modeling of mechanical systems (e.g., mechatronic, vibrational, robotic and smart systems) in state-space. Topics: Description and analysis of linear mechanical systems, transform and transition matrix methods and properties such as stability, controllability/stabilizability, observability/detectability.

*Prerequisite(s): Graduate standing or advisor approval.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
  - ME xxxx Required for Specialty Area (see below) 6 Credits
  - ME xxxx Electives, approved by graduate adviser 6 Credits
  - Free Electives 6 Credits

**Total: 30 Credits**

**Note:**

If students decide to do a ME 997x Master Thesis (9 credits) as part of their work for the degree, these 9 credits will be counted against 3 credits out of the 6 credits in ME electives, 3 credits out of the 6 credits in ME Required for the Specialty Area credits and 3 credits out of the 6 credits of Free Electives. Students are not allowed to submit more than three courses (9 credits) starting with a 5 for MS degree requirements satisfaction. Departmental electives include courses with a mechanical (ME), aerospace (AE) or materials (MT) prefix, plus departmental thesis or project credits. All courses and program details are subject to adviser approval.

**Controls and Dynamic Systems Specialty**

In the Controls and Dynamic Systems area, at least three graduate courses come from the list of courses under this heading. See courses below.
Requirements for the Master of Science

Course requirements for the MS in Mechanical Engineering are suited to the applicant’s specialty, which is specified by the student in the admissions process or during the first advising session. Students must take at least 21 credits out of the 30 credits needed for the degree at Polytechnic. No more than 6 credits in “Guided Reading” courses are allowed. Validation credit is not allowed, but the graduate adviser may waive specific requirements (and substitute designated ones), based upon the student’s prior studies or experience. - courses not related to the graduate program as stated in this catalog;
- courses that received a grade lower than B.

Studies for the MS must be completed in five years, unless a formal leave of absence is approved before the period for which studies are interrupted.

The degree requirements are:

**ME 6003 Applied Mathematics in Mechanical Engineering**

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 6043 Transport Phenomena**

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 6213 Introduction to Solid Mechanics**

3 Credits The course explores fundamentals of kinematics of solid bodies; displacement and strain measures, introduction to statics of solid bodies, stress tensor, equilibrium equations. Topics include analysis of columns, beams and beams on elastic foundations.
ME 6603 Digital Control Systems

3 Credits The course introduces digital systems, signal conversion techniques, $z$-transform and inverse $z$-transform, transfer function and block diagrams, state-variable techniques, controllability, observability, stability and control design techniques.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6703 Linear Control Theory and Design I

3 Credits The course covers modeling of mechanical systems (e.g., mechatronic, vibrational, robotic and smart systems) in state-space. Topics: Description and analysis of linear mechanical systems, transform and transition matrix methods and properties such as stability, controllability/stabilizability, observability/detectability.

Prerequisite(s): Graduate standing or advisor approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
- ME xxxx Required for Specialty Area (see below) 6 Credits
- ME xxxx Electives, approved by graduate adviser 6 Credits
- Free Electives 6 Credits

Total: 30 Credits

Note:

If students decide to do a ME 997x Master Thesis (9 credits) as part of their work for the degree, these 9 credits will be counted against 3 credits out of the 6 credits in ME electives, 3 credits out of the 6 credits in ME Required for the Specialty Area credits and 3 credits out of the 6 credits of Free Electives. Students are not allowed to submit more than three courses (9 credits) starting with a 5 for MS degree requirements satisfaction. Departmental electives include courses with a mechanical (ME), aerospace (AE) or materials (MT) prefix, plus departmental thesis or project credits. All courses and program details are subject to adviser approval.

Fluid Dynamics and Thermal Systems Specialty

In the Fluid Dynamics and Thermal Systems area, at least three graduate courses come from the list of courses under this heading. See courses below.

Mechanical Engineering, Mechanics and Structural Systems Specialty, M.S.
Requirements for the Master of Science

Course requirements for the MS in Mechanical Engineering are suited to the applicant’s specialty, which is specified by the student in the admissions process or during the first advising session. Students must take at least 21 credits out of the 30 credits needed for the degree at Polytechnic. No more than 6 credits in “Guided Reading” courses are allowed. Validation credit is not allowed, but the graduate adviser may waive specific requirements (and substitute designated ones), based upon the student’s prior studies or experience. - undergraduate courses;
- courses counted toward satisfying undergraduate degree requirements;
- courses not related to the graduate program as stated in this catalog;
- courses that received a grade lower than B.

Studies for the MS must be completed in five years, unless a formal leave of absence is approved before the period for which studies are interrupted.

The degree requirements are:

**ME 6003 Applied Mathematics in Mechanical Engineering**

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 6043 Transport Phenomena**

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 6213 Introduction to Solid Mechanics**

3 Credits The course explores fundamentals of kinematics of solid bodies; displacement and strain measures, introduction to statics of solid bodies, stress tensor, equilibrium equations. Topics include analysis of columns, beams and beams on elastic foundations.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
ME 6603 Digital Control Systems

3 Credits The course introduces digital systems, signal conversion techniques, z-transform and inverse z-transform, transfer function and block diagrams, state-variable techniques, controllability, observability, stability and control design techniques.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6703 Linear Control Theory and Design I

3 Credits The course covers modeling of mechanical systems (e.g., mechatronic, vibrational, robotic and smart systems) in state-space. Topics: Description and analysis of linear mechanical systems, transform and transition matrix methods and properties such as stability, controllability/ stabilizability, observability/ detectability.

Prerequisite(s): Graduate standing or advisor approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
- ME xxxx Required for Specialty Area (see below) 6 Credits
- ME xxxx Electives, approved by graduate adviser 6 Credits
- Free Electives 6 Credits

Total: 30 Credits

Note:

If students decide to do a ME 997x Master Thesis (9 credits) as part of their work for the degree, these 9 credits will be counted against 3 credits out of the 6 credits in ME electives, 3 credits out of the 6 credits in ME Required for the Specialty Area credits and 3 credits out of the 6 credits of Free Electives. Students are not allowed to submit more than three courses (9 credits) starting with a 5 for MS degree requirements satisfaction. Departmental electives include courses with a mechanical (ME), aerospace (AE) or materials (MT) prefix, plus departmental thesis or project credits. All courses and program details are subject to adviser approval.

Mechanics and Structural Systems Specialty

In the Mechanics and Structural Systems area, at least three graduate courses come from the list of courses under this heading. See courses below.

Organizational Behavior, Human Resource Information Systems Concentration, M.S.

The Curriculum

In any concentration there are four components to the Master of Science in Organizational Behavior degree:
1. Core Courses (required)
2. Concentration Courses (including required electives)
3. Free Electives
4. Research Project

A total of 12 courses (36 credits) are required in these four components, as described below.

1. Core Courses

Core courses provide an introduction to the theory, research and practice basic to the field of organizational behavior. This scientific foundation consists of three core courses upon which the student can build a more applied cutting-edge specialization within the degree program.

Students who have previously completed courses as undergraduates in any of these areas may be excused from taking them by presenting proof of competence and receiving waivers from the Academic Director. Other courses must be substituted with permission of the Academic Director. The core courses should be taken as early in the program as possible.

Required Core Courses: 9 Credits

**MG 6013 Organizational Behavior**

*3 Credits* Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6313 Organization Theory and Design**

*3 Credits* Introduction to theories of organizations including structure, design and culture. Provides an understanding of how organizations work and their interrelationship with the external environment. Examines the process by which managers select and manage aspects of structure and culture to achieve organizational goals. Topics include characteristics of bureaucracy, adhocracy, sub-optimization, human dynamics and informal systems; influence and control systems; management of technology; and planned change. Examination of organizations through research and case studies.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6333 Research Methods**

*3 Credits* This course introduces theories and techniques related to research methods applied to organizations. It also provides an understanding of why and how organizational research is carried out. The focus is on analyzing organizational problems and using research as a problem-solving tool. Topics include problem definition, theoretical framework, hypothesis development, research design, experimental designs, measurement, data-collection methods, sampling strategies and preparing research proposals. Students develop a research proposal they apply to a problem of interest.
Prerequisite(s): MG 5050 or undergraduate statistics course.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

2. Areas of Concentration

Students are expected to choose an area of concentration, representing the applications or technologies, built on the scientific foundations from the field of Organizational Behavior. This may be one of the four concentrations listed below or, with the Academic Director’s approval, a concentration may be revised to consist of 18 credits of courses designed to meet a student’s special needs.

Each concentration consists of 9 credits of required courses plus 9 credits of elective courses selected from a list in each concentration. Courses in each concentration may consist of both 3 credit and 1.5 credit courses.

Students who have previously completed a specific course as undergraduates in any of the areas of concentration may be excused from taking that course by presenting proof of competence and receiving a waiver from the Academic Director. Other courses must be substituted, with permission of the Academic Director.

Courses in each of the four areas of concentration are shown below:

3. Free Electives: 6 Credits Maximum

Up to 6 credits of related graduate courses may be chosen from any program at Polytechnic with the Academic Director’s permission.

4. Research Project: 3 Credits

All students must submit an independent research project, typically during the final semester.

MG 9343 Research Project in Organizational Behavior

3 Credits This project integrates and applies advanced research techniques used in studies of organizations. Students develop and carry out individual applied research projects

Prerequisite(s): Advanced standing and MG 6333 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Human Resource Information Systems: 18 Credits

The concentration in human resource information systems integrates knowledge and skills in information systems and web-based technologies together with human resource management to achieve organizational effectiveness.

Required:

MG 6123 Human Resource Management
3 Credits This course introduces the broad range of human resource functions and their organizational role. It addresses issues in managing people that have an impact not only on HR professionals but also on line managers. The course is divided into four modules: (1) an overview of HRM from a strategic perspective; (2) the management of human resources, including recruitment and selection, performance management, compensation and benefits, training and career support; (3) human resource challenges, including diversity, procedural justice and ethics, collective bargaining and managing change and innovation; and (4) professional roles in HRM.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6263 Human Resource Information Systems

3 Credits This course introduces the design, selection, implementation, enhancement and operation of human-resource information systems (HRIS), a computer-based tool that allows the efficient entry and updating of employee-related information. The focus is on the design and use of HRIS to facilitate the objectives of HR functions and of the organization. Students participate in a “hands-on” experience with the design of prototype simulations and database programming systems used to solve common HR problems and efficiently manage employee information.

Corequisite(s): MG 6123 or instructor’s permission.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6283 Web-Based Human Resource Management

3 Credits This course surveys the effective use and application of Internet and Intranet technologies for HR functions. Topics include employee self-service and online recruiting as well as software that handles peer reviews, applicant tracking, performance management, succession planning and benefits administration. Issues include best practices in using Web technology for HRM; creating websites to achieve organizational goals; determining HR information to include in an organization website; impact of Web technology on organization design; evaluating privacy and security issues; and developing a vision and a plan for utilizing Web technology in HRM.

Corequisite(s): MG 6123 or instructor’s permission.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Electives, Select 9 Credits:

MG 6163 Job and Workplace Design

3 Credits This course examines theory, research and applications of job and workplace design. Presented from an interdisciplinary perspective, the course shows how job design influences attitudes and work behavior within organizations. Students learn diagnostic tools for measuring and evaluating jobs and the psycho-social aspects of the workplace environment, as well as the principles of work redesign. Topics include the influences on work design by innovations in information technology, modern manufacturing, virtual work arrangements and open office systems; design and support of effective work teams;
reengineering and total quality management; and privacy and communication in the workplace.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6173 Performance Management and Reward Systems

3 Credits Students learn to create performance-appraisal systems that include theoretical and applied issues. Topics include coaching and feedback; team settings; multi-source feedback and self-ratings; executive performance; and improving evaluations. The course examines the role of compensation, benefits and other rewards in attracting, retaining and motivating employees, including technical and professional personnel.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6181 Talent Management

1.5 Credits In this survey course, students gain a knowledge and understanding of the strategies and range of processes, methods and tools that organizations use in effective Talent Management programs. The focus is on developing and managing leadership talent and on Talent Management practices for general management, professional, technical and other positions. Topics include identifying and competing for critical talent pools; alignment and integration of HR practices; recruiting and employment branding; identifying, selecting, developing, reviewing and managing leadership talent; retention and recognition strategies; and career paths and career planning.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6223 Staffing Organizations

3 Credits This course examines the design and management of successful staffing practices used to build, deploy and retain a quality workforce to achieve organizational effectiveness and individual job satisfaction. Topics include staffing strategy; human-resource planning and workforce diversity; job analysis; recruitment; hiring methods; the reliability and validity of employee-assessment methods; and retention management. The course reviews psychological theories of personnel assessment and integrates legal issues pertaining to staffing practices.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6271 Managing Human Resource Technology in Organizations

1.5 Credits This course examines factors critical to the effective organizational adoption and use of technology in human-resource applications. Topics include project management; HR data and process standardization; organizational governance; the
unique security requirements of HR data; metrics; and HR process and technology outsourcing. By understanding these issues and how organizations can address them, students improve their ability to plan and to implement effectively HR process reengineering and HR technology.

Corequisite(s): MG 6123 or instructor's permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6503 Management of Information Technology and Information Systems

3 Credits This course is for managers who need to understand the role and potential contribution of information technologies in organizations. The course focuses on different information technologies and their applications in managing business-critical data, information and knowledge. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process re-engineering, knowledge management and group support systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7173 Enterprise Data Systems

3 Credits The course addresses modern issues of large-scale information and knowledge management through the design, development and implementation of different kinds of database technologies. The course introduces and elaborates data modeling through relational models, SQL applications, database architecture, different types of database-management systems, and data integrity and administration. The course introduces emerging database technologies, such as distributed Internet-based databases, distributed client/server databases, multidimensional databases, groupware, data warehousing, and data mining for decision support.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8653 Managing Technological Change and Innovation

3 Credits This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

Also listed under: MN 8653.

2. Areas of Concentration

Students are expected to choose an area of concentration, representing the applications or technologies, built on the scientific foundations from the field of Organizational Behavior. This may be one of the four concentrations listed below or, with the Academic Director’s approval, a concentration may be revised to consist of 18 credits of courses designed to meet a student’s special needs.

Each concentration consists of 9 credits of required courses plus 9 credits of elective courses selected from a list in each concentration. Courses in each concentration may consist of both 3 credit and 1.5 credit courses.

Students who have previously completed a specific course as undergraduates in any of the areas of concentration may be excused from taking that course by presenting proof of competence and receiving a waiver from the Academic Director. Other courses must be substituted, with permission of the Academic Director.

Courses in each of the four areas of concentration are shown below:

3. Free Electives: 6 Credits Maximum

Up to 6 credits of related graduate courses may be chosen from any program at Polytechnic with the Academic Director’s permission.

4. Research Project: 3 Credits

All students must submit an independent research project, typically during the final semester.

MG 9343 Research Project in Organizational Behavior

Prerequisite(s): Advanced standing and MG 6333 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Human Resource Management: 18 Credits

The concentration in human resource management prepares professionals to deal with the critical human issues involved in staffing, evaluating and rewarding employees in an era of rapidly changing work environments.
Required:

**MG 6123 Human Resource Management**

3 Credits This course introduces the broad range of human resource functions and their organizational role. It addresses issues in managing people that have an impact not only on HR professionals but also on line managers. The course is divided into four modules: (1) an overview of HRM from a strategic perspective; (2) the management of human resources, including recruitment and selection, performance management, compensation and benefits, training and career support; (3) human resource challenges, including diversity, procedural justice and ethics, collective bargaining and managing change and innovation; and (4) professional roles in HRM.

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6173 Performance Management and Reward Systems**

3 Credits Students learn to create performance-appraisal systems that include theoretical and applied issues. Topics include coaching and feedback; team settings; multi-source feedback and selfratings; executive performance; and improving evaluations. The course examines the role of compensation, benefits and other rewards in attracting, retaining and motivating employees, including technical and professional personnel.

*Corequisite(s): MG 6123 or instructor’s permission.*

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6223 Staffing Organizations**

3 Credits This course examines the design and management of successful staffing practices used to build, deploy and retain a quality workforce to achieve organizational effectiveness and individual job satisfaction. Topics include staffing strategy; human-resource planning and workforce diversity; job analysis; recruitment; hiring methods; the reliability and validity of employee-assessment methods; and retention management. The course reviews psychological theories of personnel assessment and integrates legal issues pertaining to staffing practices.

*Corequisite(s): MG 6123 or instructor’s permission.*

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Electives, Select 9 Credits:

**MG 6113 Career Management**
3 Credits This course integrates theory, research and practice pertaining to careers in organizations, particularly as they change through the life span. It examines careers from the perspectives of both the individual and the organization, including topics such as career-stage models, organizational entry, early career development, mid-career transition, career change and career issues for women. The course develops greater understanding and insight into one’s own career growth and development through the use of career-assessment techniques and standardized instruments for self-evaluation.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6133 Labor Relations

3 Credits This course introduces labor relations from various perspectives in both union and nonunion organizations. Topics include labor movement history; the current state of the labor movement; labor statistics; labor laws and practices; union organizing; negotiating; economics and labor unions; contract administration; achieving cooperation; grievances; labor and employment arbitration; employee discipline; engineering and professional unions, public sector unions; global aspects; and the future for unions.

Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6143 Conflict Management

3 Credits This course investigates the nature and meaning of conflict in professional and technical organizations and in society. It analyzes the design of conflict avoidance and mitigation programs. Alternative dispute resolution modalities are presented and demonstrated. Students learn strategies to build successful relationships on an ongoing basis, and how to build skills around collaborative conflict resolution.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6181 Talent Management

1.5 Credits In this survey course, students gain a knowledge and understanding of the strategies and range of processes, methods and tools that organizations use in effective Talent Management programs. The focus is on developing and managing leadership talent and on Talent Management practices for general management, professional, technical and other positions. Topics include identifying and competing for critical talent pools; alignment and integration of HR practices; recruiting and employment branding; identifying, selecting, developing, reviewing and managing leadership talent; retention and recognition strategies; and career paths and career planning.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6191 Coaching in Organizations
1.5 Credits This course focuses on the role of coaching in organizations as part of a talent-management program to develop human resources. Students gain an understanding of the definition, theoretical basis, functions and models of coaching. Topics: How coaching is linked to the adult development lifecycle and the range of contexts in which it is applied. How coaching is used in leadership development as well as performance management, the multicultural aspects of coaching and the access minorities have to coaching. The course provides a familiarity with different coaching tools and instruments as well as how leading organizations use coaching in their talent management programs. Issues related to certification as a coach are addressed.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6211 Outsourcing: A Human Capital Strategy

1.5 Credits This comprehensive course prepares students from a variety of disciplines with the knowledge and skills necessary for a “make or buy” decision when considering outsourcing human capital. Topics include strategic implications, financial aspects, project management, internal consulting, metrics, legal considerations, development of an effective template RFP (request for proposal), internal communication details, and management of the vendor/provider relationship.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6253 Seminar in Organization and Career Change

3 Credits This course explores organizational restructuring, including downsizing, reengineering, delayering, mergers and acquisitions, and focuses on the impact of such change on professional and managerial careers. The course emphasizes current organizational and individual management practices in coping with rapid structural, cultural and technological change in the work environment. Experts from the private and public sectors and from consulting firms address these management practices.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6263 Human Resource Information Systems

3 Credits This course introduces the design, selection, implementation, enhancement and operation of human-resource information systems (HRIS), a computer-based tool that allows the efficient entry and updating of employee-related information. The focus is on the design and use of HRIS to facilitate the objectives of HR functions and of the organization. Students participate in a “hands-on” experience with the design of prototype simulations and database programming systems used to solve common HR problems and efficiently manage employee information.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6271 Managing Human Resource Technology in Organizations

1.5 Credits This course examines factors critical to the effective organizational adoption and use of technology in human-resource applications. Topics include project management; HR data and process standardization; organizational governance; the unique security requirements of HR data; metrics; and HR process and technology outsourcing. By understanding these issues
and how organizations can address them, students improve their ability to plan and to implement effectively HR process reengineering and HR technology.

**Corequisite(s):** MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6283 Web-Based Human Resource Management**

*3 Credits* This course surveys the effective use and application of Internet and Intranet technologies for HR functions. Topics include employee self-service and online recruiting as well as software that handles peer reviews, applicant tracking, performance management, succession planning and benefits administration. Issues include best practices in using Web technology for HRM; creating websites to achieve organizational goals; determining HR information to include in an organization website; impact of Web technology on organization design; evaluating privacy and security issues; and developing a vision and a plan for utilizing Web technology in HRM.

**Corequisite(s):** MG 6123 or instructor’s permission.
**Note:** Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6293 Managing Technical Professionals**

*3 Credits* This course provides a survey of research and practice focusing on the effective management of technical professionals, who have come to represent a significant segment of the labor force. The success of organizations today is largely a result of the knowledge and skills applied by their technical professional employees. The effective management of such a work force has been one of the most critical problems faced by organizations that depend on their contributions. This course closely examines research and case studies that examine various management techniques to improve the utilization, development and motivation of technical professionals for achieving high levels of performance, innovation and creativity.

**Prerequisite(s):** MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6321 Global Human Resource Management**

*1.5 Credits* This course is an overview of human-resource management practices in today’s global work environment. Topics include international/socio-cultural diversity; key characteristics of select countries’ international business behavior; international strategic alliances; identification, recruiting and selection of international personnel; training and development of expatriates and home-country nationals; evaluation and coaching of employees in international organizations; intercultural skills acquisition for the line manager and human resources professional; team-development strategies; and design of practical language learning tools for the HR professional and the line manager.

**Corequisite(s):** MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8653 Managing Technological Change and Innovation**

*3 Credits* This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature,
viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

Also listed under: MN 8653.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Organizational Behavior, Management of Change Concentration, M.S.

The Curriculum

In any concentration there are four components to the Master of Science in Organizational Behavior degree:

1. Core Courses (required)
2. Concentration Courses (including required electives)
3. Free Electives
4. Research Project

A total of 12 courses (36 credits) are required in these four components, as described below.

1. Core Courses

Core courses provide an introduction to the theory, research and practice basic to the field of organizational behavior. This scientific foundation consists of three core courses upon which the student can build a more applied cutting-edge specialization within the degree program.

Students who have previously completed courses as undergraduates in any of these areas may be excused from taking them by presenting proof of competence and receiving waivers from the Academic Director. Other courses must be substituted with permission of the Academic Director. The core courses should be taken as early in the program as possible.

Required Core Courses: 9 Credits

**MG 6013 Organizational Behavior**

*3 Credits* Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6313 Organization Theory and Design

3 Credits Introduction to theories of organizations including structure, design and culture. Provides an understanding of how organizations work and their interrelationship with the external environment. Examines the process by which managers select and manage aspects of structure and culture to achieve organizational goals. Topics include characteristics of bureaucracy, adhocracy, sub-optimization, human dynamics and informal systems; influence and control systems; management of technology; and planned change. Examination of organizations through research and case studies.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6333 Research Methods

3 Credits This course introduces theories and techniques related to research methods applied to organizations. It also provides an understanding of why and how organizational research is carried out. The focus is on analyzing organizational problems and using research as a problem-solving tool. Topics include problem definition, theoretical framework, hypothesis development, research design, experimental designs, measurement, data-collection methods, sampling strategies and preparing research proposals. Students develop a research proposal they apply to a problem of interest.

Prerequisite(s): MG 5050 or undergraduate statistics course.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

2. Areas of Concentration

Students are expected to choose an area of concentration, representing the applications or technologies, built on the scientific foundations from the field of Organizational Behavior. This may be one of the four concentrations listed below or, with the Academic Director’s approval, a concentration may be revised to consist of 18 credits of courses designed to meet a student’s special needs.

Each concentration consists of 9 credits of required courses plus 9 credits of elective courses selected from a list in each concentration. Courses in each concentration may consist of both 3 credit and 1.5 credit courses.

Students who have previously completed a specific course as undergraduates in any of the areas of concentration may be excused from taking that course by presenting proof of competence and receiving a waiver from the Academic Director. Other courses must be substituted, with permission of the Academic Director.

Courses in each of the four areas of concentration are shown below:

3. Free Electives: 6 Credits Maximum

Up to 6 credits of related graduate courses may be chosen from any program at Polytechnic with the Academic Director’s permission.

4. Research Project: 3 Credits

All students must submit an independent research project, typically during the final semester.
MG 9343 Research Project in Organizational Behavior

3 Credits This project integrates and applies advanced research techniques used in studies of organizations. Students develop and carry out individual applied research projects

Prerequisite(s): Advanced standing and MG 6333 or instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Management of Change: 18 Credits

The concentration in management of change provides human resource professionals and managers with the latest tools and techniques necessary to guide organizations and their employees through periods of rapid, potentially disruptive change, especially transitions created by changing technologies.

Required:

MG 6163 Job and Workplace Design

3 Credits This course examines theory, research and applications of job and workplace design. Presented from an interdisciplinary perspective, the course shows how job design influences attitudes and work behavior within organizations. Students learn diagnostic tools for measuring and evaluating jobs and the psycho-social aspects of the workplace environment, as well as the principles of work redesign. Topics include the influences on work design by innovations in information technology, modern manufacturing, virtual work arrangements and open office systems; design and support of effective work teams; reengineering and total quality management; and privacy and communication in the workplace.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6243 Organization Development

3 Credits This course surveys theory, research and applications related to the process of managing planned change in organizations. Organization development (OD) encompasses a variety of interventions and techniques, including strategic management sessions, team building, organizational climate studies, career development and job enrichment. The course addresses the practical application of group, inter-group and individual changes; planned structural revisions in formal organizations; and the dynamics of organizational change processes. Experiential techniques are emphasized.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6253 Seminar in Organization and Career Change
This course explores organizational restructuring, including downsizing, reengineering, delayering, mergers and acquisitions, and focuses on the impact of such change on professional and managerial careers. The course emphasizes current organizational and individual management practices in coping with rapid structural, cultural and technological change in the work environment. Experts from the private and public sectors and from consulting firms address these management practices.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Electives, Select 9 Credits:

MG 6113 Career Management

This course integrates theory, research and practice pertaining to careers in organizations, particularly as they change through the life span. It examines careers from the perspectives of both the individual and the organization, including topics such as career-stage models, organizational entry, early career development, mid-career transition, career change and career issues for women. The course develops greater understanding and insight into one’s own career growth and development through the use of career-assessment techniques and standardized instruments for self-evaluation.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6123 Human Resource Management

This course introduces the broad range of human resource functions and their organizational role. It addresses issues in managing people that have an impact not only on HR professionals but also on line managers. The course is divided into four modules: (1) an overview of HRM from a strategic perspective; (2) the management of human resources, including recruitment and selection, performance management, compensation and benefits, training and career support; (3) human resource challenges, including diversity, procedural justice and ethics, collective bargaining and managing change and innovation; and (4) professional roles in HRM.

Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6143 Conflict Management

This course investigates the nature and meaning of conflict in professional and technical organizations and in society. It analyzes the design of conflict avoidance and mitigation programs. Alternative dispute resolution modalities are presented and demonstrated. Students learn strategies to build successful relationships on an ongoing basis, and how to build skills around collaborative conflict resolution.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6153 Leadership and Team Development

3 Credits This course focuses on the essential role of multifaceted leadership in diverse organizational settings, especially those utilizing technology. Students learn the nature of leadership and its relationship to team development and organizational effectiveness. The course broadly surveys theory and research on leadership and teams in organizations. Students learn a hands-on approach involving experiential learning and case analyses. Working in teams, students are required to participate actively.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6181 Talent Management

1.5 Credits In this survey course, students gain a knowledge and understanding of the strategies and range of processes, methods and tools that organizations use in effective Talent Management programs. The focus is on developing and managing leadership talent and on Talent Management practices for general management, professional, technical and other positions. Topics include identifying and competing for critical talent pools; alignment and integration of HR practices; recruiting and employment branding; identifying, selecting, developing, reviewing and managing leadership talent; retention and recognition strategies; and career paths and career planning.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6191 Coaching in Organizations

1.5 Credits This course focuses on the role of coaching in organizations as part of a talent-management program to develop human resources. Students gain an understanding of the definition, theoretical basis, functions and models of coaching. Topics: How coaching is linked to the adult development lifecycle and the range of contexts in which it is applied. How coaching is used in leadership development as well as performance management, the multicultural aspects of coaching and the access minorities have to coaching. The course provides a familiarity with different coaching tools and instruments as well as how leading organizations use coaching in their talent management programs. Issues related to certification as a coach are addressed.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6201 Consulting in Organizations

1.5 Credits This course provides a practical orientation to consulting in organizations within an academic framework. The course prepares students from a variety of disciplines for roles as internal and external consultants by building knowledge and skills to successfully take a client and project from entry through termination and evaluation. Each student is required to take a project from conception to presentation. This project gives students an in-depth understanding of the details and issues that consultants need to address.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6211 Outsourcing: A Human Capital Strategy
1.5 Credits This comprehensive course prepares students from a variety of disciplines with the knowledge and skills necessary for a “make or buy” decision when considering outsourcing human capital. Topics include strategic implications, financial aspects, project management, internal consulting, metrics, legal considerations, development of an effective template RFP (request for proposal), internal communication details, and management of the vendor/provider relationship.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6233 Training in Organizations

3 Credits This overview of numerous forms of training and related learning activities found in the modern workplace includes management development, technical training, career planning and mentoring. The course focuses on training as both an asset to the organization and a necessity for delivering goods or services that customers value. Topics include needs analysis, preparation of employees for jobs, training program design, traditional training methods, computer-based methods, development, implementation and evaluation of training, targeting various groups with special training needs, and management development.

Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6271 Managing Human Resource Technology in Organizations

1.5 Credits This course examines factors critical to the effective organizational adoption and use of technology in human-resource applications. Topics include project management; HR data and process standardization; organizational governance; the unique security requirements of HR data; metrics; and HR process and technology outsourcing. By understanding these issues and how organizations can address them, students improve their ability to plan and to implement effectively HR process reengineering and HR technology.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6321 Global Human Resource Management

1.5 Credits This course is an overview of human-resource management practices in today’s global work environment. Topics include international/ socio-cultural diversity; key characteristics of select countries’ international business behavior; international strategic alliances; identification, recruiting and selection of international personnel; training and development of expatriates and home-country nationals; evaluation and coaching of employees in international organizations; intercultural skills acquisition for the line manager and human resources professional; team-development strategies; and design of practical language learning tools for the HR professional and the line manager.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8653 Managing Technological Change and Innovation

3 Credits This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the
The full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

Organizational Behavior, Training and Development Concentration, M.S.

The Curriculum

In any concentration there are four components to the Master of Science in Organizational Behavior degree:

1. Core Courses (required)
2. Concentration Courses (including required electives)
3. Free Electives
4. Research Project

A total of 12 courses (36 credits) are required in these four components, as described below.

1. Core Courses

Core courses provide an introduction to the theory, research and practice basic to the field of organizational behavior. This scientific foundation consists of three core courses upon which the student can build a more applied cutting-edge specialization within the degree program.

Students who have previously completed courses as undergraduates in any of these areas may be excused from taking them by presenting proof of competence and receiving waivers from the Academic Director. Other courses must be substituted with permission of the Academic Director. The core courses should be taken as early in the program as possible.

Required Core Courses: 9 Credits

MG 6013 Organizational Behavior

3 Credits Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6313 Organization Theory and Design

3 Credits Introduction to theories of organizations including structure, design and culture. Provides an understanding of how organizations work and their interrelationship with the external environment. Examines the process by which managers select and manage aspects of structure and culture to achieve organizational goals. Topics include characteristics of bureaucracy, adhocracy, sub-optimization, human dynamics and informal systems; influence and control systems; management of technology; and planned change. Examination of organizations through research and case studies.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6333 Research Methods

3 Credits This course introduces theories and techniques related to research methods applied to organizations. It also provides an understanding of why and how organizational research is carried out. The focus is on analyzing organizational problems and using research as a problem-solving tool. Topics include problem definition, theoretical framework, hypothesis development, research design, experimental designs, measurement, data-collection methods, sampling strategies and preparing research proposals. Students develop a research proposal they apply to a problem of interest.

Prerequisite(s): MG 5050 or undergraduate statistics course.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

2. Areas of Concentration

Students are expected to choose an area of concentration, representing the applications or technologies, built on the scientific foundations from the field of Organizational Behavior. This may be one of the four concentrations listed below or, with the Academic Director’s approval, a concentration may be revised to consist of 18 credits of courses designed to meet a student’s special needs.

Each concentration consists of 9 credits of required courses plus 9 credits of elective courses selected from a list in each concentration. Courses in each concentration may consist of both 3 credit and 1.5 credit courses.

Students who have previously completed a specific course as undergraduates in any of the areas of concentration may be excused from taking that course by presenting proof of competence and receiving a waiver from the Academic Director. Other courses must be substituted, with permission of the Academic Director.

Courses in each of the four areas of concentration are shown below:

3. Free Electives: 6 Credits Maximum

Up to 6 credits of related graduate courses may be chosen from any program at Polytechnic with the Academic Director’s permission.

4. Research Project: 3 Credits

All students must submit an independent research project, typically during the final semester.
MG 9343 Research Project in Organizational Behavior

3 Credits This project integrates and applies advanced research techniques used in studies of organizations. Students develop and carry out individual applied research projects.

Prerequisite(s): Advanced standing and MG 6333 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Training and Development: 18 Credits

The concentration in training and development prepares human resource professionals to design, administer and evaluate complex training and development programs, particularly in organizations affected by the introduction of new technology.

Required:

MG 6113 Career Management

3 Credits This course integrates theory, research and practice pertaining to careers in organizations, particularly as they change through the life span. It examines careers from the perspectives of both the individual and the organization, including topics such as career-stage models, organizational entry, early career development, mid-career transition, career change and career issues for women. The course develops greater understanding and insight into one’s own career growth and development through the use of career-assessment techniques and standardized instruments for self-evaluation.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6233 Training in Organizations

3 Credits This overview of numerous forms of training and related learning activities found in the modern workplace includes management development, technical training, career planning and mentoring. The course focuses on training as both an asset to the organization and a necessity for delivering goods or services that customers value. Topics include needs analysis, preparation of employees for jobs, training program design, traditional training methods, computer-based methods, development, implementation and evaluation of training, targeting various groups with special training needs, and management development.

Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6243 Organization Development

3 Credits This course surveys theory, research and applications related to the process of managing planned change in organizations. Organization development (OD) encompasses a variety of interventions and techniques, including strategic management sessions, team building, organizational climate studies, career development and job enrichment. The course addresses the practical application of group, inter-group and individual changes; planned structural revisions in formal organizations; and the dynamics of organizational change processes. Experiential techniques are emphasized.
Corequisite(s): MG 6013 or instructor’s permission.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Electives, Select 9 Credits:

**MG 6123 Human Resource Management**

3 Credits This course introduces the broad range of human resource functions and their organizational role. It addresses issues in managing people that have an impact not only on HR professionals but also on line managers. The course is divided into four modules: (1) an overview of HRM from a strategic perspective; (2) the management of human resources, including recruitment and selection, performance management, compensation and benefits, training and career support; (3) human resource challenges, including diversity, procedural justice and ethics, collective bargaining and managing change and innovation; and (4) professional roles in HRM.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6143 Conflict Management**

3 Credits This course investigates the nature and meaning of conflict in professional and technical organizations and in society. It analyzes the design of conflict avoidance and mitigation programs. Alternative dispute resolution modalities are presented and demonstrated. Students learn strategies to build successful relationships on an ongoing basis, and how to build skills around collaborative conflict resolution.

Corequisite(s): MG 6013 or instructor’s permission.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6153 Leadership and Team Development**

3 Credits This course focuses on the essential role of multifaceted leadership in diverse organizational settings, especially those utilizing technology. Students learn the nature of leadership and its relationship to team development and organizational effectiveness. The course broadly surveys theory and research on leadership and teams in organizations. Students learn a hands-on approach involving experiential learning and case analyses. Working in teams, students are required to participate actively.

Corequisite(s): MG 6013 or instructor’s permission.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6163 Job and Workplace Design**
3 Credits This course examines theory, research and applications of job and workplace design. Presented from an interdisciplinary perspective, the course shows how job design influences attitudes and work behavior within organizations. Students learn diagnostic tools for measuring and evaluating jobs and the psycho-social aspects of the workplace environment, as well as the principles of work redesign. Topics include the influences on work design by innovations in information technology, modern manufacturing, virtual work arrangements and open office systems; design and support of effective work teams; reengineering and total quality management; and privacy and communication in the workplace.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6181 Talent Management

1.5 Credits In this survey course, students gain a knowledge and understanding of the strategies and range of processes, methods and tools that organizations use in effective Talent Management programs. The focus is on developing and managing leadership talent and on Talent Management practices for general management, professional, technical and other positions. Topics include identifying and competing for critical talent pools; alignment and integration of HR practices; recruiting and employment branding; identifying, selecting, developing, reviewing and managing leadership talent; retention and recognition strategies; and career paths and career planning.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6191 Coaching in Organizations

1.5 Credits This course focuses on the role of coaching in organizations as part of a talent-management program to develop human resources. Students gain an understanding of the definition, theoretical basis, functions and models of coaching. Topics: How coaching is linked to the adult development lifecycle and the range of contexts in which it is applied. How coaching is used in leadership development as well as performance management, the multicultural aspects of coaching and the access minorities have to coaching. The course provides a familiarity with different coaching tools and instruments as well as how leading organizations use coaching in their talent management programs. Issues related to certification as a coach are addressed.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6201 Consulting in Organizations

1.5 Credits This course provides a practical orientation to consulting in organizations within an academic framework. The course prepares students from a variety of disciplines for roles as internal and external consultants by building knowledge and skills to successfully take a client and project from entry through termination and evaluation. Each student is required to take a project from conception to presentation. This project gives students an in-depth understanding of the details and issues that consultants need to address.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6253 Seminar in Organization and Career Change
3 Credits This course explores organizational restructuring, including downsizing, reengineering, delayering, mergers and acquisitions, and focuses on the impact of such change on professional and managerial careers. The course emphasizes current organizational and individual management practices in coping with rapid structural, cultural and technological change in the work environment. Experts from the private and public sectors and from consulting firms address these management practices.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6271 Managing Human Resource Technology in Organizations

1.5 Credits This course examines factors critical to the effective organizational adoption and use of technology in human-resource applications. Topics include project management; HR data and process standardization; organizational governance; the unique security requirements of HR data; metrics; and HR process and technology outsourcing. By understanding these issues and how organizations can address them, students improve their ability to plan and to implement effectively HR process reengineering and HR technology.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6321 Global Human Resource Management

1.5 Credits This course is an overview of human-resource management practices in today’s global work environment. Topics include international/ socio-cultural diversity; key characteristics of select countries’ international business behavior; international strategic alliances; identification, recruiting and selection of international personnel; training and development of expatriates and home-country nationals; evaluation and coaching of employees in international organizations; intercultural skills acquisition for the line manager and human resources professional; team-development strategies; and design of practical language learning tools for the HR professional and the line manager.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8653 Managing Technological Change and Innovation

3 Credits This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

Also listed under: MN 8653.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Physics, M.S.
Master of Science in Physics

The Master of Science in Physics will be offered only on the Brooklyn Campus and the courses will be offered primarily in the evening. Admitted students will be expected to have a BS in physics or a closely-related discipline and to make up any deficiencies before commencing graduate studies. Letters of recommendation, GRE and TOEFL scores, and application letters will be considered in the admission process.

Degree Requirements

Completion of the Master of Science in Physics requires a minimum of 30 semester credits. Students are required to take 6 credits of basic courses (a 3-credit course in quantum mechanics and two semesters of graduate seminar) with the balance of the necessary credits earned in elective physics courses. The elective courses may include a 6-credit research project or a 9-credit thesis in physics. Choice of a project or thesis option and of elective courses should be made with the approval of the graduate adviser. As many as 9 credits of physics courses taken elsewhere may be accepted towards the degree, with the approval of the graduate adviser. No comprehensive examination is required for the master's degree in physics.

Minimum Course Requirements

**PH 6673 Quantum Mechanics I**

3 Credits Quantum mechanics with applications to atomic systems. The use of Schrodinger’s equations. Angular momentum and spin. Semi-classical theory of field-matter interaction.

Prerequisite(s): MA 2122 and PH 3234 or equivalents.

Also listed under: EL 6553.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 9531 Graduate Seminar in Physics I**

1.5 Credits Students presenting current topics in Physics in a seminar setting to other students and supervising faculty. Topics chosen by the student with guidance from faculty.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 9541 Graduate Seminar in Physics II**

1.5 Credits Students presenting current topics in Physics in a seminar setting to other students and supervising faculty. Topics chosen by the student with guidance from faculty.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Elective Courses: 24 Credits

Of elective courses, 4 will be allowed at the 5000 level.

**PH 5343 Physical Basis of Nanotechnology**

*3 Credits* This course focuses on the underlying physical basis of nanotechnology. Introduction to nanotechnology, examples of nanoscale systems. Systematics in miniaturization from the mm to the nm scale. Limits to miniaturization. Quantum concepts and elementary Schrodinger theory. Quantum effects in the behavior of chemical matter. Examples of self-assembled nanosystems from nature and from contemporary industrial products.

*Prerequisite(s):* PH 2033.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 5443 Physical Techniques and Applications of Nanotechnology**

*Prerequisite(s):* PH 2033.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 5473 Modern Optics**

*Prerequisite(s):* MA 2122 and PH 3234 or equivalents.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 5481 Modern Optics Lab**

*1 Credits* The modern optics laboratory includes experimental investigations into laser modes, velocity of light by time-of-flight, Fourier optics, holography, Fourier transform spectroscopy, crystal optics and nonlinear optics.

*Pre/Co-requisite: PH 5473 or equivalent.*

Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**PH 5493 Physics of Nanoelectronics**
3 Credits This course covers limits to the ongoing miniaturization (Moore’s Law) of the successful silicon-device technology imposed by physical limitations of energy dissipation, quantum tunneling and discrete quantum electron states. Quantum physical concepts and elementary Schrodinger theory. Conductance quantum and magnetic flux quantum. Alternative physical concepts appropriate for devices of size scales of 1 to 10 nanometers, emphasizing role of power dissipation. Tunnel diode, resonant tunnel diode, electron wave transistor; spin valve, tunnel valve, magnetic disk and random access memory; single electron transistor, molecular crossbar latch, quantum cellular automata including molecular and magnetic realizations. Josephson junction and “rapid single flux quantum” computation. Photo- and x-ray lithographic patterning, electron beam patterning, scanning probe microscopes for observation and for fabrication; cantilever array as dense memory, use of carbon nanotubes and of DNA and related biological elements as building blocks and in selfassembly strategies.

Prerequisite(s): PH 2033.
Also listed under: EL 5533.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 5533 Physics of Quantum Computing

3 Credits This course explores limits to the performance of binary computers, traveling salesman and factorization problems, security of encryption. The concept of the quantum computer based on linear superposition of basis states. The information content of the qubit. Algorithmic improvements enabled in the hypothetical quantum computer. Isolated two-level quantum systems, the principle of linear superposition as well established. Coherence as a limit on quantum computer realization. Introduction of concepts underlying the present approaches to realizing qubits (singly and in interaction) based on physical systems. The systems in present consideration are based on light photons in fiber optic systems; electron charges in double well potentials, analogous to the hydrogen molecular ion; nuclear spins manipulated via the electron-nuclear spin interaction, and systems of ions such as Be and Cd which are trapped in linear arrays using methods of ultra-high vacuum, radiofrequency trapping and laser-based cooling and manipulation of atomic states. Summary and comparison of the several approaches.

Prerequisite(s): PH 2033.
Also listed under: EL 5553.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 5663 Physics of Alternative Energy

3 Credits The course examines non-petroleum sources of energy including photovoltaic cells, photocatalytic generators of hydrogen from water, and nuclear fusion reactors. The advanced physics of these emerging technical areas are introduced in this course. Semiconductor junctions, optical absorption in semiconductors, photovoltaic effect. Energy conversion efficiency of the silicon solar cell. Single crystal, polycrystal, and thin film types of solar cells. Excitons in bulk and in confined geometries. Excitons in energy transport within an absorbing structure. Methods of making photocatalytic surfaces and structures for water splitting. Conditions for nuclear fusion. Plasmas and plasma compression. The toroidal chamber with magnetic coils as it appears in recent designs. Nuclear fusion by laser compression (inertial fusion). Small scale exploratory approaches to fusion based on liquid compression and electric field ionization of deuterium gas.

Prerequisite(s): PH 2033.
Also listed under: EL 5663.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6403 Physical Concepts of Polymer Nanocomposites

3 Credits This course presents fundamental aspects of polymer nanocomposites and updates on recent advancements and modern applications. Topics include nanostructured materials; assembly at interfaces; interactions on surfaces; properties of polymer nanocomposites; reliability; nanodevices.
**PH 6513 Introduction to Solid-State Physics I**

*3 Credits* Phenomena and theory of physics of crystalline solids. Topics from thermal, magnetic, electrical and optical properties of metals, insulators and semiconductors.

*Prerequisite(s): PH 2344 or equivalent.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 6523 Introduction to Solid-State Physics II**

*3 Credits* Phenomena and theory of physics of crystalline solids. Topics from thermal, magnetic, electrical and optical properties of metals, insulators and semiconductors.

*Prerequisite(s): PH 6513.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 6553 Advanced Quantum Computing**

*3 Credits* Advanced topics in quantum computation are explored.

*Prerequisite(s): PH 5553.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 6683 Quantum Mechanics II**

*3 Credits* Quantum mechanics with applications to atomic systems. The use of Schrödinger’s equations. Angular momentum and spin. Semi-classical theory of field-matter interaction.

*Prerequisite(s): PH 6673.*

*Also listed under: EL 6563.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 8013 Selected Topics in Advanced Physics**

*3 Credits* Current or advanced topics of particular interest to graduate students are examined. Subject matter is determined each year by students and faculty. The course may be given in more than one section. Consult department office for current offerings.

*Note: this course is not offered every semester.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 8023 Selected Topics in Advanced Physics**
3 Credits Current or advanced topics of particular interest to graduate students are examined. Subject matter is determined each year by students and faculty. The course may be given in more than one section. Consult department office for current offerings.

Note: this course is not offered every semester.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 999X PhD Dissertation in Physics

3 Credits An original investigation in some branch of physics, which may serve as basis for the MS or PhD degree, is performed under the direction of a member of the department. The number of research credits registered for each semester should realistically reflect the time devoted to research.

Prerequisite(s): Degree status and graduate advisers and research director’s consent.

Total Credits: 30

Systems Engineering (Online), M.S.

Systems Engineering

Systems engineers manage the details of large projects encompassing multiple disciplines. One day they work with physicists and astronomers; the next, architects and mathematicians. Typically without a specialty of their own, systems engineers must be proficient in enough technical areas to be able to do their job well. They must also know how to manage budgets, maintain schedules, meet performance goals, and work harmoniously with others to ensure a project’s success.

It’s a developing field perfectly suited to NYU-Poly’s i²e philosophy of invention, innovation, and entrepreneurship. Students learn the specifics of systems engineering: methods of modeling and simulation, theories of communication and control, and data analysis.

The MS in Systems Engineering program trains you to perform computer simulations, as well as signal and systems analysis — all to address real-system problems. The program also covers a range of topics, such as feedback control and instrumentation, to guarantee that students walk away with a baseline understanding of systems engineering project management. The program entails three core courses and two tracks; at least one must be a core track.

Required Core Courses

You must choose 3 courses from the following:

EL 5213 Introduction to Systems Engineering

3 Credits This course introduces fundamentals of systems engineering process. Topics: Multidisciplinary systems methodology, design and analysis of complex systems. Brief history of systems engineering. Mathematical models. Objective functions and constraints. Optimization tools. Topics to be covered include identification, problem definition, synthesis, analysis and evaluation activities during conceptual and preliminary system design phases. Decision analysis and utility theory. Information flow analysis
in organizations. Elements of systems management, including decision styles, human information processing, organizational decision processes and information system design for planning and decision support. Basic economic modeling and analysis. Requirements development, life-cycle costing, scheduling and risk analysis. Application of computer-aided systems engineering (CASE) tools.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6213 System Modeling, Analysis and Design**

*3 Credits* Introduction of basic system concepts such as system state, inputs, outputs and disturbances. Modeling methods and Computer Aided Systems Engineering (CASE) formal structures. CASE tools for solving practical systems related problems. Quantitative techniques including linear programming, network flow analysis, integer and nonlinear programming, Petri nets, basic probabilistic and stochastic tools, Markov processes, queueing theory and Monte Carlo techniques for simulation. Fundamentals of decision and risk analysis.

Prerequisite(s): EL 5213. Corequisite(s): EL 6303 recommended.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6233 System Optimization Method**

*3 Credits* Formulations of system optimization problems. Elements of functional analysis applied to system optimization. Local and global system optimization with and without constraints. Variational methods, calculus of variations, and linear, nonlinear and dynamic programming iterative methods. Examples and applications. Newton and Lagrange multiplier algorithms, convergence analysis.

Prerequisite(s): Graduate status and EL 5253 or EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6253 Linear Systems**

*3 Credits* Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.

Prerequisite(s): Graduate status and EE 3054 or EL 5253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6303 Probability Theory**

Prerequisite(s): Graduate status and MA 3012.
Also listed under: BE 6453.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8203 Project Management**

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Core Tracks of Systems Engineering**

**Network Management**

**EL 5363 Principles of Communication Networks**

3 Credits This course covers all fundamental aspects of communications networks. Topics are: protocol architecture, data transmission and signal encoding, multiplexing, spread spectrum, data link control, local area networks, wireless LAN, circuit switching, packet switching, routing, traffic control, Internet protocol, transport layer protocol, application design and the basics of network security.

Prerequisite(s): MA 3012 or instructor’s permission.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 5373 Internet Architecture and Protocols**

3 Credits This course introduces basic local area networking technologies and protocols in a set of lectures and laboratory experiments. Topics: link level protocols. Local area networks: CSMA/CD, Token Ring, IEEE standards and protocols. The Internet protocol suite: IP, ARP, RARP, ICMP, UDP and TCP. LAN Interconnection: bridges, routers and gateways. Application protocols: SNMP, FTP, SMTP and NFS.
Prerequisite(s): EL 5363 or EE 136.
Also listed under: EE 4173.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6373 Local and Metropolitan Area Networks

3 Credits This course introduces students to fundamental design issues in wireless and wired local and metropolitan area networks, explains the state-of-the-art solutions proposed and deployed in the field by using latest standards and protocols as examples, and discusses trends in the wireless/wired LAN/MANs. Example wireless technologies covered include the IEEE 802 family of protocols, e.g., WiFi, WiMax and Bluetooth. Example wireline technologies include those associated with Ethernet and MAN technologies such as Resilient Packet Ring.

Prerequisite(s): EL 5363 or EE 136 or instructor’s permission.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7353 Communication Networks I: Analysis, Modeling and Performance

3 Credits The course introduces the analytical techniques used in the design and performance analysis of networks. Building on their knowledge of networking technology and applied mathematics, especially probability, students learn basic queuing theory, to be applied to performance analysis of multiplexers, switches and multiple access networks. Newer techniques such as the network calculus, the study of non-Poissonian long range dependent traffic sources and applications to TCP, admission control, advanced packet switches and IEEE 802.11 networks are introduced.

Prerequisite(s): EL 5363 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7363 Communications Networks II: Design and Algorithms

3 Credits The course covers network design, which consists of topology design and traffic routing taking into account dynamics in network states, such as link/node failures and traffic demand variations. Efficient design models and optimization methods are crucial to simultaneously achieve good network user performance and high savings in network deployment and maintenance. This course introduces mathematical models, design problems and optimization algorithms that can be used to guide network design practice. Subjects include: Network Design Problem Modeling, Optimization Methods, Multi-Commodity Flow Routing, Location and Topological Design, Fair Networks, Resilient Network Design, Robust Network Design, Multi-Layer Networks.

Prerequisite(s): Graduate status, EL 5363 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Wireless Communications
EL 5013 Wireless Personal Communication Systems

3 Credits The course introduces underlying principles of wireless communications and practical systems. Topics: Science and technology including radio signal propagation, interference-limited communications, multiple access, radio resources management and mobility management. Building blocks of wireless networks. Essential functions of cellular telephone systems and wireless local area networks. Details of the most important technologies including GSM, CDMA, wideband CDMA and WiFi (IEEE802.11).

Prerequisite(s): EE 3404 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5023 Wireless Information Systems Laboratory I

3 Credits This course includes hands-on experience with a combination of laboratory experiments, lectures and projects relating to spread spectrum code division multiple access (CDMA) wireless communication systems. Specific topics include pseudo-noise code generation, transmitters and receivers for direct sequence and frequency hopping systems, acquisition and tracking, CDMA wireless computer communications, UHF channel propagation characteristics including multipath time delay profiles and attenuation measurements, bit error rate measurements, phase locked loops and spectrum sharing with existing narrowband users.

Prerequisite(s): Graduate status or EE 3404.
Also listed under: EE 4183.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

EL 6013 Principles of Digital Communications: Modulation and Coding

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6023 Wireless Communications: Channel Modeling and Receiver Design

3 Credits The course focuses on wireless communication channel models and practical techniques for mitigating transmission impairments. Topics: Channel Modeling Parameters: Path loss; Fading: long-term vs. short-term fading, flat vs. frequency selective fading and slow vs. fast fading; Multipath spread parameters: delay spread, angular spread and Doppler spread, Matrix Channel Modeling for Multiple Input and Multiple Output (MIMO) Systems. Channel Parameter Estimation: training sequence and blind approaches. Mitigation: Mitigation of path loss and fading: Diversity, handoff and power control; Mitigation of intersymbol interference: rake receiver and equalizer; Mitigation of time variation: pilot symbols and dynamic tracking. Processing Techniques: LS, zero forcing, MMSE, LMS, etc.

Prerequisite(s): Graduate status or EE 3404, MA 3012.
Note: Online version available.
EL 6033 Modern Wireless Communication Techniques and Systems

3 Credits The course covers Multiple Access and Multiplexing Techniques; Spread spectrum and Code division multiple access (CDMA) techniques: Direct sequence, Frequency hopping; Multicarrier Techniques: Orthogonal frequency division (OFDM) and Multicarrier CDMA (MC-CDMA); New Wireless Communication Systems: Ultra Wideband communications, Wireless Fidelity (Wi-Fi), Radio Frequency Identification (RFID), Bluetooth, etc.

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5223 Sensor Based Robotics

3 Credits The course covers robot mechanisms, robot arm kinematics (direct and inverse kinematics), robot arm dynamics (Euler-Lagrange, Newton-Euler and Hamiltonian Formulations), six degree-of-freedom rigid body kinematics and dynamics, quaternion, nonholonomic systems, trajectory planning, various sensors and actuators for robotic applications, end-effector mechanisms, force and moment analysis, introduction to control of robotic manipulators.

Prerequisite(s): Graduate status. Corequisite(s): EE 3064. Pre/Co-requisite: EE 3064.
Also listed under: ME 6613.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5253 Applied Matrix Theory

Prerequisite(s): Graduate status, MA 2012, MA 2132, MA 2112 and MA 2122.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6243 System Theory and Feedback Control

3 Credits Design of single-input-output and multivariable systems in frequency domain. Stability of interconnected systems from component transfer functions. Parameterization of stabilizing controllers. Introduction to optimization (Wiener-Hopf design).

Prerequisite(s): Graduate status and EE 3064.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 6253 Linear Systems

3 Credits Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.

Prerequisite(s): Graduate status and EE 3054 or EL 5253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 8223 Applied Nonlinear Control

3 Credits Stability and stabilization for nonlinear systems; Lyapunov stability and functions, input-output stability and control Lyapunov functions. Differential geometric approaches for analysis and control of nonlinear systems: controllability, observability, feedback linearization, normal form, inverse dynamics, stabilization, tracking and disturbance attenuation. Analytical approaches: recursive back stepping, input-to-state stability, nonlinear small-gain methods and passivity. Output feedback designs. Various application examples for nonlinear systems including robotic and communication systems.

Prerequisite(s): Graduate status and EL 6253 or EL 7253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Energy Systems

EL 5613 Introduction to Electric Power Systems

3 Credits The course focuses on basic concepts in electric power systems. Topics: single-and-three-phase circuits, power triangle; transmission lines parameters: resistance, inductance, capacitance, transformers and generators; lumped component piequivalent circuit representation; perunit normalization; symmetrical phase components; load-flow program.

Prerequisite(s): EE 2024 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6623 Power Systems Economics and Planning

3 Credits Power-system economics: revenue requirements, load duration and reserve requirements. Load forecasting: econometric methods. Optimal expansion planning and methodologies: optimal generation expansion computer modeling. Decision analysis techniques. Deregulation of electric power industry.

Prerequisite(s): Graduate status and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6633 Transients, Surges and Faults in Power Systems

3 Credits Analysis of lumped-circuit, normal and abnormal transients in power equipment and systems. Short-circuit fault analysis and transient recovery of three-phase circuits. Analysis of traveling-wave surges on transmission lines, windings and
integrated systems.

Prerequisite(s): Graduate status and EL 5613 or equivalent.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6653 Power System Stability**

3 Credits The course introduces power-system dynamics: mathematical modeling of prime movers, power plants, synchronous machines, field exciters transmission lines, relay loads and stabilizers.

Prerequisite(s): Graduate status, EE 3824 and EL 5613.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Large Scale Systems Modeling and Control**

**EL 6243 System Theory and Feedback Control**

3 Credits Design of single-input-output and multivariable systems in frequency domain. Stability of interconnected systems from component transfer functions. Parameterization of stabilizing controllers. Introduction to optimization (Wiener-Hopf design).

Prerequisite(s): Graduate status and EE 3064.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6253 Linear Systems**

3 Credits Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.

Prerequisite(s): Graduate status and EE 3054 or EL 5253.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 7253 State Space Design for Linear Control Systems**

3 Credits Topics covered in this course include canonical forms; control system design objectives; feedback system design by MIMO pole placement; MIMO linear observers; the separation principle; linear quadratic optimum control; random processes; Kalman filters as optimum observers; the separation theorem; LQG; Sampled-data systems; microprocessor-based digital control; robust control and the servocompensator problem.

Prerequisite(s): Graduate status and EL 6253.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 8253 Large-Scale Systems and Decentralized Control**

**Prerequisite(s):** Graduate status and EL 7253 or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 92X3 Selected Topics in Control Systems (X=1, 2,...9)**

3 Credits The course discusses topics of current interest to feedback and control-system engineers. (See department mailing for detailed description of each particular offering.)

**Prerequisite(s):** Specified when offered.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Multimedia Applications**

**EL 5123 Image Processing**

3 Credits The course focuses on image formation and perception; image acquisition, representation and display; image sampling and resizing; contrast enhancement; two-dimensional Fourier transform and other unitary transforms; frequency domain and spatial domain linear filtering; median and morphological filtering; image smoothing, sharpening and edge detection through linear and nonlinear filtering; color image representation and processing; lossless and lossy image coding techniques and standards, image deblurring; imaging geometry, image registration and geometric transformation. Students also learn to implement selected imaging processing algorithms in MATLAB or C-language.

**Prerequisite(s):** Graduate student status or EE 3054 and MA 3012.  
Also listed under: BE 6223.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 5143 Multimedia Laboratory**

3 Credits This course provides hands-on experience in processing and communication of speech, audio, image and video signals. Topics include sampling and quantization, sampling rate conversion, lossless and lossy compression, basic techniques in speech, audio, image and video coding, multimedia conferencing, video on-demand, video multicasting, multimedia document creation. Students are exposed to popular software and hardware for multimedia signal processing and document creation. Each week includes a lecture and a lab.

**Prerequisite(s):** Graduate status or EE 3054 or equivalent.  
Also listed under: EE 4153.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

**EL 6113 Signals, Systems and Transforms**

Prerequisite(s): Graduate status.
Also listed under: BE 6403.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6123 Video Processing

3 Credits This course covers Fourier analysis of video signals, properties of the human visual system, video signal sampling and sampling rate conversion, motion modeling and estimation, video compression techniques and standards, stereo video processing and compression, error control in networked video applications, analog and digital video systems. Students will learn to implement selected algorithms in MATLAB or C-language. A course-project is required.

Prerequisite(s): EL 5123 or EL 5143 and EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6643 Computer Vision and Scene Analysis

3 Credits An important goal of artificial intelligence is to equip computers with the capability to interpret visual inputs. Computer vision and scene analysis is an AI area that deals with constructing explicit, meaningful descriptions of physical objects from images. It includes many techniques from image processing, pattern recognition, geometric modeling and cognitive processing. This course introduces the many techniques and applications of computer vision and scene analysis.

Prerequisite(s): Graduate status, CS 5403 and MA 2012, or equivalents, or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Elective Tracks of Systems Engineering

Computer Systems and Security

CS 6813 Information, Security and Privacy

3 Credits This course introduces Information Systems Security and covers cryptography, capability and access control mechanisms, authentication models, security models, operating systems security, malicious code, security policy formation and enforcement, vulnerability analysis, evaluating secure systems.

Prerequisite(s): Graduate status.
Note: Online version available.
CS 6823 Network Security

3 Credits This course begins by covering attacks and threats in computer networks, including network mapping, port scanning, sniffing, DoS, DDoS, reflection attacks, attacks on DNS and leveraging P2P deployments for attacks. The course continues with cryptography topics most relevant to secure networking protocols. Topics covered are block ciphers, stream ciphers, public key cryptography, RSA, Diffie Hellman, certification authorities, digital signatures and message integrity. After surveying basic cryptographic techniques, the course examines several secure networking protocols, including PGP, SSL, IPsec and wireless security protocols. The course examines operational security, including firewalls and intrusion-detection systems. Students read recent research papers on network security and participate in an important lab component that includes packet sniffing, network mapping, firewalls, SSL and IPsec.

Prerequisite(s): Graduate status and EL 5363 or CS 6843.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
- CS 9043 Selected Topics in CS

EL 6393 Advanced Network Security

3 Credits While the recent proliferation of broadband wire-line and wireless networking technologies have substantially increased the available network capacity and enabled a wide-range of feature-rich high-speed communication services, security remains a major concern. Network attacks have become common recurring events that increasingly threaten the proper functioning and continual success of the communication infrastructure and services. One way to mitigate such threats is to develop new security/defense architectures, systems, methodologies and algorithms that can scale together with the communications infrastructure in terms of operating speed, operational simplicity and manageability. This course aims to understand the theoretical, architectural, system and implementation issues related to all aspects of security in high-speed networks and study various proposed solutions. Students are required to read research papers and complete a term project with either simulation programs to evaluate the proposed schemes, or architecture/VHDL designs for the schemes.

Prerequisite(s): CS 6823 or adviser approval.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Software Engineering

CS 6063 Software Engineering I

3 Credits The course emphasizes the full software-engineering approach with alternative approaches. Technical emphasis is on requirements, design, development and modeling. Management issues include software cost estimating and project management. Understanding the processes applicable to the software development/integration cycle and maintenance along with technology changes on quality and development activities is highlighted.
CS 6073 Software Engineering II

3 Credits The course covers modern, advanced software engineering approaches with theory and practice orientations. Important design and management issues are analyzed and evaluated. Technical and management tradeoffs in distributed software systems are emphasized. An extensive number of real world case studies are assessed. A class project is required.

Prerequisite(s): Graduate status and CS 6063.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6083 Principles of Database Systems

3 Credits This course broadly introduces database systems, including the relational data model, query languages, database design, index and file structures, query processing and optimization, concurrency and recovery, transaction management and database design. Students acquire hands-on experience in working with database systems and in building web-accessible database applications.

Prerequisite(s): Graduate status, CS 6003 or equivalent, familiarity with basic data structures and operating system principles.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6183 Fault-Tolerant Computers

3 Credits This course introduces a variety of hardware and software techniques to design and model fault-tolerant computers. Topics include coding techniques (Hamming, SECSED, SECDED, etc.); majority voting schemes (TMR); software redundancy (Nversion programming); software-recovery schemes; network reliability design and estimation. The course introduces probabilistic methods for reliability modeling. Other topics: Examples from space fault tolerant systems, networks, commercial nonstop systems (TANDEM and STRATUS). RAID memory systems. Fault-tolerant modeling tools such as HARP, SHURE and SHARPE.

Prerequisite(s): Graduate status and CS 6133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Operations Research and Management

MG 6303 Operations Management

3 Credits This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6463 Supply Chain Management

3 Credits This course introduces supply-chain management and covers its qualitative and quantitative aspects. The underlying objective is to: (1) introduce students to the standard business concepts (and associated terminology) involved in the retailing and supply-chain management; (2) develop skills in understanding and analyzing retailing, marketing, logistics, operations, channel management and allied issues and the interactions between them; and (3) examine and discuss the important role played by technology and integration at various points in the supply chain.

Also listed under: MN 6463.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses, Project selection and portfolio optimization, Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6023 Economic Foundations in Finance

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand, consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Financial Engineering

FRE 6023 Economic Foundations in Finance

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6083 Quantitative Methods in Finance
3 Credits This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

Prerequisite(s): Students are expected to know calculus and elementary probability.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6103 Corporate Finance

3 Credits The modern corporation, as issuer of financial securities and end-user of financial risk management products, is a major participant in financial markets and the economic counterpart to investors and financial intermediaries. The mechanism of financial markets and the valuation of instruments are studied in further detail in other courses. However, this course applies the tools of the trade of financial economics and corporate finance to the financial decision-making process of firms. Upon successful completion of this course, students know how to contribute to optimal financial decisions in a corporation: valuation; capital budgeting; risk; capital structure; dividend policy; long-term financing; risk management; and mergers and acquisitions. Increasingly important international factors that affect corporate finance are stressed throughout.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6291 Applied Derivative Contracts

1.5 Credits This course provides an introduction to derivative contracts with a special emphasis on current practical applications in use today by financial institutions for investing, hedging, trading and issuing. The characteristics and features of futures, forwards, swaps, options and structured notes are all covered with a special emphasis on useful applications. For each of the four primary derivative contracts, we review in these lectures the appropriate definitions, terminology, market mechanics and theoretical fair value pricing.

Prerequisite(s): FRE 6003, FRE 6023, FRE 6103 and graduate standing
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6411 Fixed Income Securities and Interest Rate Derivatives

1.5 Credits This course examines the body of analytical tools and measures that constitute modern fixed-income markets. The valuation of interest-rate sensitive cash flows is the unifying theme. Major topics include theories of term structure, institutional aspects of fixed-income markets and analytical techniques for managing interest-rate risk. Bond refunding, defeasance, corporate bonds, forwards, futures, options and interest-rate swaps are discussed. The course gives an overview of the major classes of fixed-income securities and the markets in which they trade. Among the major classes of fixed-income instruments discussed are Treasury and agency securities, mortgage-backed securities (including CMOs and Strips), asset-backed securities, municipals, floating and inverse floating rate securities.

Prerequisite(s): FRE 6023, FRE 6083 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Biological Systems

Selected courses with prefix BE, CH, CM, subject to adviser approval.
Minimum Total: 30 Credits

**Systems Engineering, M.S.**

**Requirements for the Master of Science**

The entrance requirement for a Master of Science in Systems Engineering is a bachelor’s degree in engineering or science from an accredited institution, with a GPA of 3.0 or above in undergraduate courses. For some tracks, students need undergraduate courses in differential equations, probability, linear systems, feedback control and computer programming. Students with subject-area deficiencies should take the necessary required courses.

To satisfy MS in Systems Engineering requirements, students must complete three core courses and two tracks; at least one must be a core track. A minimum of three courses should be taken in a track. One course in each track may be a core course. Students can choose the remaining credits (up to 9 credits) from any science, engineering and management courses. If a student elects to write a MS thesis (6 credits), only two courses in a track are required. The total number of credits required is 30 and at least 15 credits should be from EL-prefixed courses. A GPA of 3.0 or above is required in all graduate courses.

**Core Courses: 9 Credits**

Three courses from among the following:

**EL 5213 Introduction to Systems Engineering**

3 Credits This course introduces fundamentals of systems engineering process. Topics: Multidisciplinary systems methodology, design and analysis of complex systems. Brief history of systems engineering. Mathematical models. Objective functions and constraints. Optimization tools. Topics to be covered include identification, problem definition, synthesis, analysis and evaluation activities during conceptual and preliminary system design phases. Decision analysis and utility theory. Information flow analysis in organizations. Elements of systems management, including decision styles, human information processing, organizational decision processes and information system design for planning and decision support. Basic economic modeling and analysis. Requirements development, life-cycle costing, scheduling and risk analysis. Application of computer-aided systems engineering (CASE) tools.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6213 System Modeling, Analysis and Design**

3 Credits Introduction of basic system concepts such as system state, inputs, outputs and disturbances. Modeling methods and Computer Aided Systems Engineering (CASE) formal structures. CASE tools for solving practical systems related problems. Quantitative techniques including linear programming, network flow analysis, integer and nonlinear programming, Petri nets, basic probabilistic and stochastic tools, Markov processes, queueing theory and Monte Carlo techniques for simulation. Fundamentals of decision and risk analysis.

Prerequisite(s): EL 5213. Corequisite(s): EL 6303 recommended.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 6233 System Optimization Method

3 Credits Formulations of system optimization problems. Elements of functional analysis applied to system optimization. Local and global system optimization with and without constraints. Variational methods, calculus of variations, and linear, nonlinear and dynamic programming iterative methods. Examples and applications. Newton and Lagrange multiplier algorithms, convergence analysis.

Prerequisite(s): Graduate status and EL 5253 or EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6253 Linear Systems

3 Credits Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.

Prerequisite(s): Graduate status and EE 3054 or EL 5253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6303 Probability Theory

Prerequisite(s): Graduate status and MA 3012.
Also listed under: BE 6453.

Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.
Core Tracks: 6-18 Credits

Network Management

**EL 5363 Principles of Communication Networks**

3 Credits This course covers all fundamental aspects of communications networks. Topics are: protocol architecture, data transmission and signal encoding, multiplexing, spread spectrum, data link control, local area networks, wireless LAN, circuit switching, packet switching, routing, traffic control, Internet protocol, transport layer protocol, application design and the basics of network security.

Prerequisite(s): MA 3012 or instructor’s permission.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 5373 Internet Architecture and Protocols**

3 Credits This course introduces basic local area networking technologies and protocols in a set of lectures and laboratory experiments. Topics: link level protocols. Local area networks: CSMA/CD, Token Ring, IEEE standards and protocols. The Internet protocol suite: IP, ARP, RARP, ICMP, UDP and TCP. LAN Interconnection: bridges, routers and gateways. Application protocols: SNMP, FTP, SMTP and NFS.

Prerequisite(s): EL 5363 or EE 136.
Also listed under: EE 4173.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6373 Local and Metropolitan Area Networks**

3 Credits This course introduces students to fundamental design issues in wireless and wired local and metropolitan area networks, explains the state-of-the-art solutions proposed and deployed in the field by using latest standards and protocols as examples, and discusses trends in the wireless/wired LAN/MANs. Example wireless technologies covered include the IEEE 802 family of protocols, e.g., WiFi, WiMax and Bluetooth. Example wireline technologies include those associated with Ethernet and MAN technologies such as Resilient Packet Ring.

Prerequisite(s): EL 5363 or EE 136 or instructor’s permission.
Note: Online version available.
EL 7353 Communication Networks I: Analysis, Modeling and Performance

3 Credits The course introduces the analytical techniques used in the design and performance analysis of networks. Building on their knowledge of networking technology and applied mathematics, especially probability, students learn basic queuing theory, to be applied to performance analysis of multiplexers, switches and multiple access networks. Newer techniques such as the network calculus, the study of non-Poissonian long range dependent traffic sources and applications to TCP, admission control, advanced packet switches and IEEE 802.11 networks are introduced.

Prerequisite(s): EL 5363 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7363 Communications Networks II: Design and Algorithms

3 Credits The course covers network design, which consists of topology design and traffic routing taking into account dynamics in network states, such as link/node failures and traffic demand variations. Efficient design models and optimization methods are crucial to simultaneously achieve good network user performance and high savings in network deployment and maintenance. This course introduces mathematical models, design problems and optimization algorithms that can be used to guide network design practice. Subjects include: Network Design Problem Modeling, Optimization Methods, Multi-Commodity Flow Routing, Location and Topological Design, Fair Networks, Resilient Network Design, Robust Network Design, Multi-Layer Networks.

Prerequisite(s): Graduate status, EL 5363 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Wireless Communications

EL 5013 Wireless Personal Communication Systems

3 Credits The course introduces underlying principles of wireless communications and practical systems. Topics: Science and technology including radio signal propagation, interference-limited communications, multiple access, radio resources management and mobility management. Building blocks of wireless networks. Essential functions of cellular telephone systems and wireless local area networks. Details of the most important technologies including GSM, CDMA, wideband CDMA and WiFi (IEEE802.11).

Prerequisite(s): EE 3404 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5023 Wireless Information Systems Laboratory I

3 Credits This course includes hands-on experience with a combination of laboratory experiments, lectures and projects relating to spread spectrum code division multiple access (CDMA) wireless communication systems. Specific topics include pseudo-noise code generation, transmitters and receivers for direct sequence and frequency hopping systems, acquisition and tracking,
CDMA wireless computer communications, UHF channel propagation characteristics including multipath time delay profiles and attenuation measurements, bit error rate measurements, phase locked loops and spectrum sharing with existing narrowband users.

Prerequisite(s): Graduate status or EE 3404.
Also listed under: EE 4183.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

**EL 5033 Wireless Information Systems Laboratory II**

3 Credits This course includes hands-on experience with a combination of laboratory experiments, lectures and projects relating to basic and advanced topics in wireless communications. Specific topics include mixers, IQ modulation, phase locked loops, receiver design, PN code acquisition, smart antennas and RFID.

Prerequisite(s): EL 5023.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

**EL 6013 Principles of Digital Communications: Modulation and Coding**

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6023 Wireless Communications: Channel Modeling and Receiver Design**

3 Credits The course focuses on wireless communication channel models and practical techniques for mitigating transmission impairments. Topics: Channel Modeling Parameters: Path loss; Fading: long-term vs. short-term fading, flat vs. frequency selective fading and slow vs. fast fading; Multipath spread parameters: delay spread, angular spread and Doppler spread. Matrix Channel Modeling for Multiple Input and Multiple Output (MIMO) Systems. Channel Parameter Estimation: training sequence and blind approaches. Mitigation: Mitigation of path loss and fading: Diversity, handoff and power control; Mitigation of intersymbol interference: rake receiver and equalizer; Mitigation of time variation: pilot symbols and dynamic tracking. Processing Techniques: LS, zero forcing, MMSE, LMS, etc.

Prerequisite(s): Graduate status or EE 3404, MA 3012.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6033 Modern Wireless Communication Techniques and Systems**

3 Credits The course covers Multiple Access and Multiplexing Techniques; Spread spectrum and Code division multiple access (CDMA) techniques: Direct sequence, Frequency hopping; Multicarrier Techniques: Orthogonal frequency division (OFDM) and
Multicarrier CDMA (MC-CDMA); New Wireless Communication Systems: Ultra Wideband communications, Wireless Fidelity (Wi-Fi), Radio Frequency Identification (RFID), Bluetooth, etc.

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Systems and Automation

EL 5223 Sensor Based Robotics

3 Credits The course covers robot mechanisms, robot arm kinematics (direct and inverse kinematics), robot arm dynamics (Euler-Lagrange, Newton-Euler and Hamiltonian Formulations), six degree-of-freedom rigid body kinematics and dynamics, quaternion, nonholonomic systems, trajectory planning, various sensors and actuators for robotic applications, end-effector mechanisms, force and moment analysis, introduction to control of robotic manipulators.

Prerequisite(s): Graduate status. Corequisite(s): EE 3064. Pre/Co-requisite: EE 3064. Also listed under: ME 6613.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5253 Applied Matrix Theory

Prerequisite(s): Graduate status, MA 2012, MA 2132, MA 2112 and MA 2122.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6243 System Theory and Feedback Control

3 Credits Design of single-input-output and multivariable systems in frequency domain. Stability of interconnected systems from component transfer functions. Parameterization of stabilizing controllers. Introduction to optimization (Wiener-Hopf design).

Prerequisite(s): Graduate status and EE 3064.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6253 Linear Systems

3 Credits Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.
EL 8223 Applied Nonlinear Control

3 Credits Stability and stabilization for nonlinear systems; Lyapunov stability and functions, input-output stability and control Lyapunov functions. Differential geometric approaches for analysis and control of nonlinear systems: controllability, observability, feedback linearization, normal form, inverse dynamics, stabilization, tracking and disturbance attenuation. Analytical approaches: recursive back stepping, input-to-state stability, nonlinear small-gain methods and passivity. Output feedback designs. Various application examples for nonlinear systems including robotic and communication systems.

Prerequisite(s): Graduate status and EL 6253 or EL 7253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Energy Systems

EL 5613 Introduction to Electric Power Systems

3 Credits The course focuses on basic concepts in electric power systems. Topics: single-and-three-phase circuits, power triangle; transmission lines parameters: resistance, inductance, capacitance, transformers and generators; lumpedcomponent piequivalent circuit representation; perunit normalization; symmetrical phase components; load-flow program.

Prerequisite(s): EE 2024 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6623 Power Systems Economics and Planning

3 Credits Power-system economics: revenue requirements, load duration and reserve requirements. Load forecasting: econometric methods. Optimal expansion planning and methodologies: optimal generation expansion computer modeling. Decision analysis techniques. Deregulation of electric power industry.

Prerequisite(s): Graduate status and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6633 Transients, Surges and Faults in Power Systems

3 Credits Analysis of lumped-circuit, normal and abnormal transients in power equipment and systems. Short-circuit fault analysis and transient recovery of three-phase circuits. Analysis of traveling-wave surges on transmission lines, windings and integrated systems.

Prerequisite(s): Graduate status and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6653 Power System Stability
The course introduces power-system dynamics: mathematical modeling of prime movers, power plants, synchronous machines, field exciters transmission lines, relay loads and stabilizers.

Prerequisite(s): Graduate status, EE 3824 and EL 5613.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Large Scale Systems Modeling and Control

EL 6253 Linear Systems

3 Credits Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.

Prerequisite(s): Graduate status and EE 3054 or EL 5253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6243 System Theory and Feedback Control

3 Credits Design of single-input-output and multivariable systems in frequency domain. Stability of interconnected systems from component transfer functions. Parameterization of stabilizing controllers. Introduction to optimization (Wiener-Hopf design).

Prerequisite(s): Graduate status and EE 3064.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7253 State Space Design for Linear Control Systems

3 Credits Topics covered in this course include canonical forms; control system design objectives; feedback system design by MIMO pole placement; MIMO linear observers; the separation principle; linear quadratic optimum control; random processes; Kalman filters as optimum observers; the separation theorem; LQG; Sampled-data systems; microprocessor-based digital control; robust control and the servocompensator problem.

Prerequisite(s): Graduate status and EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 8253 Large-Scale Systems and Decentralized Control

3 Credits This course introduces analysis and synthesis of large-scale systems. Topics: systemorder reduction algorithms, interconnected system stability, series expansion and singular perturbation. Lyapunov designs. Applications to traffic networks, power systems and transportation networks. Decentralized control; decentralized fixed-mode, LQR, frequency-shaped cost functional and overlapping decompositions. Stability of interconnected systems and Vector Lyapunov analysis.

Prerequisite(s): Graduate status and EL 7253 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 92X3 Selected Topics in Control Systems (X=1, 2,...9)

3 Credits The course discusses topics of current interest to feedback and control-system engineers. (See department mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Multimedia Applications

EL 5123 Image Processing

3 Credits The course focuses on image formation and perception; image acquisition, representation and display; image sampling and resizing; contrast enhancement; two-dimensional Fourier transform and other unitary transforms; frequency domain and spatial domain linear filtering; median and morphological filtering; image smoothing, sharpening and edge detection through linear and nonlinear filtering; color image representation and processing; lossless and lossy image coding techniques and standards, image deblurring; imaging geometry, image registration and geometric transformation. Students also learn to implement selected imaging processing algorithms in MATLAB or C-language.

Prerequisite(s): Graduate student status or EE 3054 and MA 3012.
Also listed under: BE 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5143 Multimedia Laboratory

3 Credits This course provides hands-on experience in processing and communication of speech, audio, image and video signals. Topics include sampling and quantization, sampling rate conversion, lossless and lossy compression, basic techniques in speech, audio, image and video coding, multimedia conferencing, video on-demand, video multicasting, multimedia document creation. Students are exposed to popular software and hardware for multimedia signal processing and document creation. Each week includes a lecture and a lab.

Prerequisite(s): Graduate status or EE 3054 or equivalent.
Also listed under: EE 4153.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

EL 6113 Signals, Systems and Transforms

Prerequisite(s): Graduate status.
Also listed under: BE 6403.

Note: Online version available.
EL 6123 Video Processing

3 Credits This course covers Fourier analysis of video signals, properties of the human visual system, video signal sampling and sampling rate conversion, motion modeling and estimation, video compression techniques and standards, stereo video processing and compression, error control in networked video applications, analog and digital video systems. Students will learn to implement selected algorithms in MATLAB or C-language. A course-project is required.

Prerequisite(s): EL 5123 or EL 5143 and EL 6303.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6643 Computer Vision and Scene Analysis

3 Credits An important goal of artificial intelligence is to equip computers with the capability to interpret visual inputs. Computer vision and scene analysis is an AI area that deals with constructing explicit, meaningful descriptions of physical objects from images. It includes many techniques from image processing, pattern recognition, geometric modeling and cognitive processing. This course introduces the many techniques and applications of computer vision and scene analysis.

Prerequisite(s): Graduate status, CS 5403 and MA 2012, or equivalents, or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Elective Tracks: 0-9 Credits

Computer Systems and Security

CS 6813 Information, Security and Privacy

3 Credits This course introduces Information Systems Security and covers cryptography, capability and access control mechanisms, authentication models, security models, operating systems security, malicious code, security policy formation and enforcement, vulnerability analysis, evaluating secure systems.

Prerequisite(s): Graduate status.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6823 Network Security

3 Credits This course begins by covering attacks and threats in computer networks, including network mapping, port scanning, sniffing, DoS, DDoS, reflection attacks, attacks on DNS and leveraging P2P deployments for attacks. The course continues with cryptography topics most relevant to secure networking protocols. Topics covered are block ciphers, stream ciphers, public key
cryptography, RSA, Diffie Hellman, certification authorities, digital signatures and message integrity. After surveying basic cryptographic techniques, the course examines several secure networking protocols, including PGP, SSL, IPsec and wireless security protocols. The course examines operational security, including firewalls and intrusion-detection systems. Students read recent research papers on network security and participate in an important lab component that includes packet sniffing, network mapping, firewalls, SSL and IPsec.

Prerequisite(s): Graduate status and EL 5363 or CS 6843.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 9223 Selected Topics in Computer Science

This course covers topics of current interest in computer science. Recent offerings include software specification and validation, parallel algorithms and architectures, client-server systems and advanced object-oriented design (Java). Advanced topics: Databases, performance analysis, computer simulation, Java programming, Unix programming, human and computer interaction, cryptography with financial applications and biometric identification.

Prerequisite(s): Graduate status; others specified when course is offered.

EL 6393 Advanced Network Security

While the recent proliferation of broadband wire-line and wireless networking technologies have substantially increased the available network capacity and enabled a wide-range of feature-rich high-speed communication services, security remains a major concern. Network attacks have become common recurring events that increasingly threaten the proper functioning and continual success of the communication infrastructure and services. One way to mitigate such threats is to develop new security-defense architectures, systems, methodologies and algorithms that can scale together with the communications infrastructure in terms of operating speed, operational simplicity and manageability. This course aims to understand the theoretical, architectural, system and implementation issues related to all aspects of security in high-speed networks and study various proposed solutions. Students are required to read research papers and complete a term project with either simulation programs to evaluate the proposed schemes, or architecture/VHDL designs for the schemes.

Prerequisite(s): CS 6823 or adviser approval.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Software Engineering

CS 6063 Software Engineering I

The course emphasizes the full software-engineering approach with alternative approaches. Technical emphasis is on requirements, design, development and modeling. Management issues include software cost estimating and project management. Understanding the processes applicable to the software development/integration cycle and maintenance along with technology changes on quality and development activities is highlighted.
Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6073 Software Engineering II

3 Credits The course covers modern, advanced software engineering approaches with theory and practice orientations. Important design and management issues are analyzed and evaluated. Technical and management tradeoffs in distributed software systems are emphasized. An extensive number of real world case studies are assessed. A class project is required.

Prerequisite(s): Graduate status and CS 6063.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6083 Principles of Database Systems

3 Credits This course broadly introduces database systems, including the relational data model, query languages, database design, index and file structures, query processing and optimization, concurrency and recovery, transaction management and database design. Students acquire hands-on experience in working with database systems and in building web-accessible database applications.

Prerequisite(s): Graduate status, CS 6003 or equivalent, familiarity with basic data structures and operating system principles.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6183 Fault-Tolerant Computers

3 Credits This course introduces a variety of hardware and software techniques to design and model fault-tolerant computers. Topics include coding techniques (Hamming, SECSED, SECDED, etc.); majority voting schemes (TMR); software redundancy (Nversion programming); software-recovery schemes; network reliability design and estimation. The course introduces probabilistic methods for reliability modeling. Other topics: Examples from space fault tolerant systems, networks, commercial nonstop systems (TANDEM and STRATUS). RAID memory systems. Fault-tolerant modeling tools such as HARP, SHURE and SHARPE.

Prerequisite(s): Graduate status and CS 6133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Operations Research and Management

MG 6303 Operations Management

3 Credits This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6463 Supply Chain Management

3 Credits This course introduces supply-chain management and covers its qualitative and quantitative aspects. The underlying objective is to: (1) introduce students to the standard business concepts (and associated terminology) involved in the retailing and supply-chain management; (2) develop skills in understanding and analyzing retailing, marketing, logistics, operations, channel management and allied issues and the interactions between them; and (3) examine and discuss the important role played by technology and integration at various points in the supply chain.

Also listed under: MN 6463.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses. Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Financial Engineering

FRE 6023 Economic Foundations in Finance

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6083 Quantitative Methods in Finance

3 Credits This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

Prerequisite(s): Students are expected to know calculus and elementary probability.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6103 Corporate Finance
3 Credits The modern corporation, as issuer of financial securities and end-user of financial risk management products, is a major participant in financial markets and the economic counterpart to investors and financial intermediaries. The mechanism of financial markets and the valuation of instruments are studied in further detail in other courses. However, this course applies the tools of the trade of financial economics and corporate finance to the financial decision-making process of firms. Upon successful completion of this course, students know how to contribute to optimal financial decisions in a corporation: valuation; capital budgeting; risk; capital structure; dividend policy; long-term financing; risk management; and mergers and acquisitions. Increasingly important international factors that affect corporate finance are stressed throughout.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6411 Fixed Income Securities and Interest Rate Derivatives

1.5 Credits This course examines the body of analytical tools and measures that constitute modern fixed-income markets. The valuation of interest-rate sensitive cash flows is the unifying theme. Major topics include theories of term structure, institutional aspects of fixed-income markets and analytical techniques for managing interest-rate risk. Bond refunding, defeasance, corporate bonds, forwards, futures, options and interest-rate swaps are discussed. The course gives an overview of the major classes of fixed-income securities and the markets in which they trade. Among the major classes of fixed-income instruments discussed are Treasury and agency securities, mortgage-backed securities (including CMOs and Strips), asset-backed securities, municipals, floating and inverse floating rate securities.

Prerequisite(s): FRE 6023, FRE 6083 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6291 Applied Derivative Contracts

1.5 Credits This course provides an introduction to derivative contracts with a special emphasis on current practical applications in use today by financial institutions for investing, hedging, trading and issuing. The characteristics and features of futures, forwards, swaps, options and structured notes are all covered with a special emphasis on useful applications. For each of the four primary derivative contracts, we review in these lectures the appropriate definitions, terminology, market mechanics and theoretical fair value pricing.

Prerequisite(s): FRE 6003, FRE 6023, FRE 6103 and graduate standing
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Biological Systems

(Selected courses with prefix BE, CH, CM, subject to adviser approval)

Free Electives: 0-9 Credits

Any courses in science, engineering or management.

Grand Total: 30 Credits

Note:
The list of tracks and approved courses within a track may be updated after publication of this catalog. Students should consult the Department of Electrical and Computer Engineering’s Graduate Student Manual (www.poly.edu/academics/departments/electrical/graduate-resources) for any updated list. The Graduate Manual also contains more detailed rules and procedures on student status, transfer credits, recommended electives, current research areas and disqualification for low grades.

Descriptions of graduate courses in engineering, science and management used in the Systems Engineering Program are found in relevant program sections of this catalog.

**Telecommunication Networks, M.S**

**Requirements for the Master of Science**

Admission to a Master of Science in Telecommunication Networks requires an undergraduate degree in computer science, computer engineering or electrical engineering with a superior undergraduate record from an accredited institution. The Graduate Record Exam (GRE) is required. Applicants with comparable degrees in other fields are considered individually for admission. Generally, entering students must have a basic knowledge of computer fundamentals, such as programming in C++, data structures and computer architecture. NYU-Poly conditionally admits students with superior academic credentials who lack sufficient background, pending completion of several individually specified preparatory courses. These courses include CS 5303, Introduction to Programming and Problem Solving, and CS 5403, Data Structures and Algorithms. However, no credit is allowed for any preparatory courses toward this degree. Other preparatory courses may be required. In some cases, students are interviewed to determine the necessary preparatory courses they need. Successful completion with a GPA of 3.0 or better is required for transfer to regular status. Admission with advanced standing is accepted in accordance with NYU-Poly regulations published in this catalog. Students may transfer a maximum of 9 credits to the MS in Telecommunications Networks from previous graduate work at an acceptable institution. To satisfy the master’s degree requirements, students must complete a total of 30 credits as described below, with an overall GPA of 3.0 or above. In addition, a 3.0 average is required in core courses described in Group 1 and Group 2 below.

Students who have satisfactorily completed equivalent courses, as determined by the program director, may replace required courses in Group 1 and Group 2 with other courses, starting with the remaining Group 2 courses. For example, a student who previously took a course equivalent to EL 5373 will be required to take the remaining four courses in Group 2. A student who previously took two or more equivalent courses from Group 1 and 2 can replace these courses with advanced courses. Program-director permission is required for all substitutions.

**Group 1 - Required Core Course: 3 Credits**

**EL 5363 Principles of Communication Networks**

*3 Credits* This course covers all fundamental aspects of communications networks. Topics are: protocol architecture, data transmission and signal encoding, multiplexing, spread spectrum, data link control, local area networks, wireless LAN, circuit switching, packet switching, routing, traffic control, Internet protocol, transport layer protocol, application design and the basics of network security.

Prerequisite(s): MA 3012 or instructor’s permission.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
Note:

Students who satisfactorily completed a course equivalent to EL 5363—e.g., EE 136, or otherwise as determined by the adviser—can replace this course by one from Group 2.

Group 2 - Additional Core Courses: 12 Credits

Students are required to take four out of the five course choices listed below.

**EL 5373 Internet Architecture and Protocols**

*3 Credits* This course introduces basic local area networking technologies and protocols in a set of lectures and laboratory experiments. Topics: link level protocols, Local area networks: CSMA/CD, Token Ring, IEEE standards and protocols. The Internet protocol suite: IP, ARP, RARP, ICMP, UDP and TCP. LAN Interconnection: bridges, routers and gateways. Application protocols: SNMP, FTP, SMTP and NFS.

*Prerequisite(s):* EL 5363 or EE 136.

*Also listed under:* EE 4173.

*Note:* Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

**CS 6843 Computer Networking**

*3 Credits* This course takes a top-down approach to computer networking. After an overview of computer networks and the Internet, the course covers the application layer, transport layer, network layer and link layers. Topics at the application layer include client-server architectures, P2P architectures, DNS and HTTP and Web applications. Topics at the transport layer include multiplexing, connectionless transport and UDP, principles or reliable data transfer, connection-oriented transport and TCP and TCP congestion control. Topics at the network layer include forwarding, router architecture, the IP protocol and routing protocols including OSPF and BGP. Topics at the link layer include multiple access protocols, ALOHA, CSMA/CD, Ethernet, CSMA/CA, wireless 802.11 networks and link layer switches. The course includes simple quantitative delay and throughput modeling, socket programming and network application development and Ethereal labs.

*Prerequisite(s):* Graduate status and CS 2134.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6373 Local and Metropolitan Area Networks**

*3 Credits* This course introduces students to fundamental design issues in wireless and wired local and metropolitan area networks, explains the state-of-the-art solutions proposed and deployed in the field by using latest standards and protocols as examples, and discusses trends in the wireless/wired LAN/MANs. Example wireless technologies covered include the IEEE 802 family of protocols, e.g., WiFi, WiMax and Bluetooth. Example wireline technologies include those associated with Ethernet and MAN technologies such as Resilient Packet Ring.

*Prerequisite(s):* EL 5363 or EE 136 or instructor's permission.

*Note:* Online version available.
EL 6383 High-Speed Networks

3 Credits This course covers the basics, architectures, protocols and technologies for high-speed networks. Topics: synchronous optical network (SONET), asynchronous transfer mode (ATM), ATM adaptation layer (AAL), 10/100/1000/10G Ethernet, Ethernet over SONET (EOS), quality of service control, packet scheduling, network processor, buffer management, flow and congestion control, TCP, high-speed TCP and XCP, Routing and IP fast rerouting, WDM networks, MPLS and GMPLS. Each student is required to complete a project that can be reading, software design or hardware design.

Prerequisite(s): Graduate status, EL 5363 or EE 136 or equivalent.
Note: Online version available.

CS 6133 Computer Architecture I

3 Credits This course provides students with an understanding of computer-hardware subsystems, digital design strategies and fundamental computer-performance and capacity-improvement techniques. Combinational and sequential circuits are developed for the essential building blocks of computers. Binary number systems are presented in both human and computer algorithms. A uniprocessor computer is built from the blocks developed. An assembly language and an instruction set are presented. Processor implementation with a data path and hardwired and microprogrammed control is introduced. Performance evaluation of computers is studied. Basic pipelining is introduced to improve system performance. Memory-hierarchy alternatives are introduced to improve the capacity of the computing system.

Prerequisite(s): Graduate status.
Note: Online version available.

CS 6233 Introduction to Operating Systems

3 Credits This course introduces basic issues in operating systems. Topics: Threads, processes, concurrency, memory management, I/O Control and case studies.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6273 Performance Evaluation of Computer Systems

3 Credits This course focuses on modeling and performance analysis of computer systems. It concentrates on testing and evaluation of three-tiered distributed client/server and WEB-based systems and generally on distributed networking systems. The course presents and evaluates various systems architectures from a macro and micro viewpoint.
Prerequisite(s): Graduate status and EL 5363 or MA 2212/MA 2222 and instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

EL 7353 Communication Networks I: Analysis, Modeling and Performance

3 Credits
The course introduces the analytical techniques used in the design and performance analysis of networks. Building on their knowledge of networking technology and applied mathematics, especially probability, students learn basic queuing theory, to be applied to performance analysis of multiplexers, switches and multiple access networks. Newer techniques such as the network calculus, the study of non-Poissonian long range dependent traffic sources and applications to TCP, admission control, advanced packet switches and IEEE 802.11 networks are introduced.

Prerequisite(s): EL 5363 and EL 6303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6823 Network Security

3 Credits
This course begins by covering attacks and threats in computer networks, including network mapping, port scanning, sniffing, DoS, DDoS, reflection attacks, attacks on DNS and leveraging P2P deployments for attacks. The course continues with cryptography topics most relevant to secure networking protocols. Topics covered are block ciphers, stream ciphers, public key cryptography, RSA, Diffie Hellman, certification authorities, digital signatures and message integrity. After surveying basic cryptographic techniques, the course examines several secure networking protocols, including PGP, SSL, IPsec and wireless security protocols. The course examines operational security, including firewalls and intrusion-detection systems. Students read recent research papers on network security and participate in an important lab component that includes packet sniffing, network mapping, firewalls, SSL and IPsec.

Prerequisite(s): Graduate status and EL 5363 or CS 6843.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:
In certain rare circumstances, and with program-director approval, students may take other computer science and electrical engineering courses to fulfill the core requirement. Students may not take both CS 6843 and EL 5373.

Group 3 - Project Requirement: 3 Credits

All Telecommunication Networks Program students are required to take a project course, either CS 6873 Project in Telecommunication Networks or EL 9953 Advanced Projects I, depending on whether the project adviser teaches in the CS or ECE department. Before registering, students must obtain a project adviser and create an approved project plan. The project should be completed in one semester. After obtaining approval, students may substitute the required 3-credit project with a 6-credit MS thesis. The extra 3 thesis credits will count toward the program elective in Group 4.

Group 4 - Program Elective Courses: 12 Credits
Students must take four courses (not already counted toward the core requirement) from the following partial course list. Other courses not on this list can be taken with program director approval.

**EL 5013 Wireless Personal Communication Systems**

3 Credits The course introduces underlying principles of wireless communications and practical systems. Topics: Science and technology including radio signal propagation, interference-limited communications, multiple access, radio resources management and mobility management. Building blocks of wireless networks. Essential functions of cellular telephone systems and wireless local area networks. Details of the most important technologies including GSM, CDMA, wideband CDMA and WiFi (IEEE802.11).

Prerequisite(s): EE 3404 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 5023 Wireless Information Systems Laboratory I**

3 Credits This course includes hands-on experience with a combination of laboratory experiments, lectures and projects relating to spread spectrum code division multiple access (CDMA) wireless communication systems. Specific topics include pseudo-noise code generation, transmitters and receivers for direct sequence and frequency hopping systems, acquisition and tracking, CDMA wireless computer communications, UHF channel propagation characteristics including multipath time delay profiles and attenuation measurements, bit error rate measurements, phase locked loops and spectrum sharing with existing narrowband users.

Prerequisite(s): Graduate status or EE 3404.
Also listed under: EE 4183.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0
- CS 5023 Introduction to Java Programming

**EL 5143 Multimedia Laboratory**

3 Credits This course provides hands-on experience in processing and communication of speech, audio, image and video signals. Topics include sampling and quantization, sampling rate conversion, lossless and lossy compression, basic techniques in speech, audio, image and video coding, multimedia conferencing, video on-demand, video multicasting, multimedia document creation. Students are exposed to popular software and hardware for multimedia signal processing and document creation. Each week includes a lecture and a lab.

Prerequisite(s): Graduate status or EE 3054 or equivalent.
Also listed under: EE 4153.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

**EL 6013 Principles of Digital Communications: Modulation and Coding**

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.
EL 6023 Wireless Communications: Channel Modeling and Receiver Design

3 Credits
The course focuses on wireless communication channel models and practical techniques for mitigating transmission impairments. Topics: Channel Modeling Parameters: Path loss; Fading: long-term vs. short-term fading, flat vs. frequency selective fading and slow vs. fast fading; Multipath spread parameters: delay spread, angular spread and Doppler spread, Matrix Channel Modeling for Multiple Input and Multiple Output (MIMO) Systems. Channel Parameter Estimation: training sequence and blind approaches. Mitigation: Mitigation of path loss and fading: Diversity, handoff and power control; Mitigation of intersymbol interference: rake receiver and equalizer; Mitigation of time variation: pilot symbols and dynamic tracking. Processing Techniques: LS, zero forcing, MMSE, LMS, etc.

Prerequisite(s): Graduate status or EE 3404, MA 3012.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6033 Modern Wireless Communication Techniques and Systems

3 Credits
The course covers Multiple Access and Multiplexing Techniques; Spread spectrum and Code division multiple access (CDMA) techniques: Direct sequence, Frequency hopping; Multicarrier Techniques: Orthogonal frequency division (OFDM) and Multicarrier CDMA (MC-CDMA); New Wireless Communication Systems: Ultra Wideband communications, Wireless Fidelity (Wi-Fi), Radio Frequency Identification (RFID), Bluetooth, etc.

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6063 Information Theory

3 Credits

Prerequisite(s): Graduate status and EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6303 Probability Theory

3 Credits

Prerequisite(s): Graduate status and MA 3012.
Also listed under: BE 6453.

Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6313 Stochastic Processes

Prerequisite(s): EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6383 High-Speed Networks

3 Credits This course covers the basics, architectures, protocols and technologies for high-speed networks. Topics: synchronous optical network (SONET), asynchronous transfer mode (ATM), ATM adaptation layer (AAL), 10/100/1000/10G Ethernet, Ethernet over SONET (EOS), quality of service control, packet scheduling, network processor, buffer management, flow and congestion control, TCP, high-speed TCP and XCP, Routing and IP fast rerouting, WDM networks, MPLS and GMPLS. Each student is required to complete a project that can be reading, software design or hardware design.

Prerequisite(s): Graduate status, EL 5363 or EE 136 or equivalent.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6393 Advanced Network Security

3 Credits While the recent proliferation of broadband wire-line and wireless networking technologies have substantially increased the available network capacity and enabled a wide-range of feature-rich high-speed communication services, security remains a major concern. Network attacks have become common recurring events that increasingly threaten the proper functioning and continual success of the communication infrastructure and services. One way to mitigate such threats is to develop new security/defense architectures, systems, methodologies and algorithms that can scale together with the communications infrastructure in terms of operating speed, operational simplicity and manageability. This course aims to understand the theoretical, architectural, system and implementation issues related to all aspects of security in high-speed
networks and study various proposed solutions. Students are required to read research papers and complete a term project with either simulation programs to evaluate the proposed schemes, or architecture/VHDL designs for the schemes.

Prerequisite(s): CS 6823 or adviser approval.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7353 Communication Networks I: Analysis, Modeling and Performance

3 Credits The course introduces the analytical techniques used in the design and performance analysis of networks. Building on their knowledge of networking technology and applied mathematics, especially probability, students learn basic queuing theory, to be applied to performance analysis of multiplexers, switches and multiple access networks. Newer techniques such as the network calculus, the study of non-Poissonian long range dependent traffic sources and applications to TCP, admission control, advanced packet switches and IEEE 802.11 networks are introduced.

Prerequisite(s): EL 5363 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7363 Communications Networks II: Design and Algorithms

3 Credits The course covers network design, which consists of topology design and traffic routing taking into account dynamics in network states, such as link/node failures and traffic demand variations. Efficient design models and optimization methods are crucial to simultaneously achieve good network user performance and high savings in network deployment and maintenance. This course introduces mathematical models, design problems and optimization algorithms that can be used to guide network design practice. Subjects include: Network Design Problem Modeling, Optimization Methods, Multi-Commodity Flow Routing, Location and Topological Design, Fair Networks, Resilient Network Design, Robust Network Design, Multi-Layer Networks.

Prerequisite(s): Graduate status, EL 5363 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7373 High Performance Switches and Routers

3 Credits This course addresses the basics, the theory, architectures and technologies to implement high-performance high-speed large-scale routers and switches. The fundamental concepts and technologies of packet forwarding, classification and switching learned in the class are useful and practical when designing IP routers, Ethernet switches and optical switches. Topics: IP Route Lookup, Packet Classification, Packet Scheduling, Buffer Management, Basics of Packet Switching, Output-buffered Switches, Shared-memory Switches, Crosspoint-buffered Switches, Input-buffered Switches, Clos-network Switches, Multi-Stage Buffered Switches, Two-Stage Load-Balanced Switches, Optical Packet Switches and ASIC for IP Routers.

Prerequisite(s): EL 5363 or adviser approval.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6033 Design and Analysis of Algorithms I
This course reviews basic data structures and mathematical tools. Topics: Data structures, priority queues, binary search trees, balanced search trees. Btrees. Algorithm design and analysis techniques illustrated in searching and sorting: heapsort, quicksort, sorting in linear time, medians and order statistics. Design and analysis techniques: dynamic programming, greedy algorithms. Graph algorithms: elementary graph algorithms (breadth first search, depth first search, topological sort, connected components, strongly connected components), minimum spanning tree, shortest path. String algorithms. Geometric algorithms. Linear programming. Brief introduction to NP completeness.

Prerequisite(s): Graduate status, CS 5403 and CS 6003.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

CS 6043 Design and Analysis of Algorithms II

This course covers techniques in advanced design and analysis. Topics: Amortized analysis of algorithms. Advanced data structures: binomial heaps, Fibonacci heaps, data structures for disjoint sets, analysis of union by rank with path compression. Graph algorithms: elementary graph algorithms, maximum flow, matching algorithms. Randomized algorithms. Theory of NP completeness and approach to finding (approximate) solutions to NP complete problems. Selected additional topics that may vary.

Prerequisite(s): Graduate status and CS 6033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6133 Computer Architecture I

This course provides students with an understanding of computer-hardware subsystems, digital design strategies and fundamental computer-performance and capacity-improvement techniques. Combinational and sequential circuits are developed for the essential building blocks of computers. Binary number systems are presented in both human and computer algorithms. A uniprocessor computer is built from the blocks developed. An assembly language and an instruction set are presented. Processor implementation with a data path and hardwired and microprogrammed control is introduced. Performance evaluation of computers is studied. Basic pipelining is introduced to improve system performance. Memory-hierarchy alternatives are introduced to improve the capacity of the computing system.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

CS 6143 Computer Architecture II

This course covers high-speed computer design. Topics: Uni-processor computer architectures that exploit parallelism, advanced pipelining, superscalar, VLIW, vector processors. Parallel processing: Interconnection structures, MIMD and SIMD systems. Other selected parallel computing topics, such as parallel algorithms, PRAM machines and multicore processing.

Prerequisite(s): Graduate status and CS 6133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6233 Introduction to Operating Systems
3 Credits This course introduces basic issues in operating systems. Topics: Threads, processes, concurrency, memory management, I/O Control and case studies.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
or

CS 6243 Operating Systems II

3 Credits This course surveys recent important commercial and research trends in operating systems. Topics may include virtualization, network server design and characterization, scheduling and resource optimization, file systems, memory management, advanced debugging techniques, data-center design and energy utilization.

Prerequisite(s): CS 6233.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6063 Software Engineering I

3 Credits The course emphasizes the full software-engineering approach with alternative approaches. Technical emphasis is on requirements, design, development and modeling. Management issues include software cost estimating and project management. Understanding the processes applicable to the software development/integration cycle and maintenance along with technology changes on quality and development activities is highlighted.

Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6083 Principles of Database Systems

3 Credits This course broadly introduces database systems, including the relational data model, query languages, database design, index and file structures, query processing and optimization, concurrency and recovery, transaction management and database design. Students acquire hands-on experience in working with database systems and in building web-accessible database applications.

Prerequisite(s): Graduate status, CS 6003 or equivalent, familiarity with basic data structures and operating system principles.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG graduate courses:

Relevant management-department graduate courses can be taken with approval from the program director. No more than two MG courses can be counted toward the MSTN degree.

Total credits needed for degree: 30 credits

Note:
Descriptions of electrical engineering, computer science and management courses can be found in this catalog’s Electrical Engineering, Computer Science and Engineering, and Technology Management program sections. Information about Graduate Certificate in Telecommunication Network Management can be found in the Electrical Engineering program section.

Telecommunications Networks (Online) M.S.

Telecommunications Networks

One of the most rapidly growing fields, telecommunications networking is embedded in almost every industry—banking, reservation systems, office-information delivery and the Internet, among thousands of other sectors.

Telecommunications experts are equipped to handle gigabit optical networks, multimedia communications and wireless network access. Students emerge from this online master’s in telecommunication networks with an in-depth knowledge of today’s rapidly accelerating advances in telecommunications, fueled by a broad spectrum of fundamental and applied courses.

6 Required Core Courses: 18 Credits

EL 5363 Principles of Communication Networks

3 Credits This course covers all fundamental aspects of communications networks. Topics are: protocol architecture, data transmission and signal encoding, multiplexing, spread spectrum, data link control, local area networks, wireless LAN, circuit switching, packet switching, routing, traffic control, Internet protocol, transport layer protocol, application design and the basics of network security.

Prerequisite(s): MA 3012 or instructor’s permission.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5373 Internet Architecture and Protocols

3 Credits This course introduces basic local area networking technologies and protocols in a set of lectures and laboratory experiments. Topics: link level protocols. Local area networks: CSMA/CD, Token Ring, IEEE standards and protocols. The Internet protocol suite: IP, ARP, RARP, ICMP, UDP and TCP. LAN Interconnection: bridges, routers and gateways. Application protocols: SNMP, FTP, SMTP and NFS.

Prerequisite(s): EL 5363 or EE 136.
Also listed under: EE 4173.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6373 Local and Metropolitan Area Networks
This course introduces students to fundamental design issues in wireless and wired local and metropolitan area networks, explains the state-of-the-art solutions proposed and deployed in the field by using latest standards and protocols as examples, and discusses trends in the wireless/wired LAN/MANs. Example wireless technologies covered include the IEEE 802 family of protocols, e.g., WiFi, WiMax and Bluetooth. Example wireline technologies include those associated with Ethernet and MAN technologies such as Resilient Packet Ring.

Prerequisite(s): EL 5363 or EE 136 or instructor’s permission.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 7353 Communication Networks I: Analysis, Modeling and Performance**

3 Credits The course introduces the analytical techniques used in the design and performance analysis of networks. Building on their knowledge of networking technology and applied mathematics, especially probability, students learn basic queuing theory, to be applied to performance analysis of multiplexers, switches and multiple access networks. Newer techniques such as the network calculus, the study of non-Poissonian long range dependent traffic sources and applications to TCP, admission control, advanced packet switches and IEEE 802.11 networks are introduced.

Prerequisite(s): EL 5363 and EL 6303.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 6133 Computer Architecture I**

3 Credits This course provides students with an understanding of computer-hardware subsystems, digital design strategies and fundamental computer-performance and capacity-improvement techniques. Combinational and sequential circuits are developed for the essential building blocks of computers. Binary number systems are presented in both human and computer algorithms. A uniprocessor computer is built from the blocks developed. An assembly language and an instruction set are presented. Processor implementation with a data path and hardwired and microprogrammed control is introduced. Performance evaluation of computers is studied. Basic pipelining is introduced to improve system performance. Memory-hierarchy alternatives are introduced to improve the capacity of the computing system.

Prerequisite(s): Graduate status.

Electives Courses: 12 Credits

Select Any 4

**EL 5473 Introduction to VLSI System Design**

*3 Credits* This course covers CMOS processing technology, MOS transistor theory, static/dynamic circuit and logic design techniques, circuit performance estimation, standard cells and gate arrays, clocking strategies, input/output structures, data path, memory and control logic design. Advanced VLSI CAD tools are used for schematic capture, layout, timing analysis and simulations for functionality and performance.

Prerequisite(s): Senior or graduate status, CS 2204 and EE 3114 or equivalent.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6013 Principles of Digital Communications: Modulation and Coding**

Prerequisite(s): EE 3404 and EL 6303.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6023 Wireless Communications: Channel Modeling and Receiver Design**

*3 Credits* The course focuses on wireless communication channel models and practical techniques for mitigating transmission impairments. Topics: Channel Modeling Parameters: Path loss; Fading: long-term vs. short-term fading, flat vs. frequency selective fading and slow vs. fast fading; Multipath spread parameters: delay spread, angular spread and Doppler spread. Matrix Channel Modeling for Multiple Input and Multiple Output (MIMO) Systems. Channel Parameter Estimation: training sequence and blind approaches. Mitigation: Mitigation of path loss and fading: Diversity, handoff and power control; Mitigation of intersymbol interference: rake receiver and equalizer; Mitigation of time variation: pilot symbols and dynamic tracking. Processing Techniques: LS, zero forcing, MMSE, LMS, etc.

Prerequisite(s): Graduate status or EE 3404, MA 3012.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 6033 Modern Wireless Communication Techniques and Systems

3 Credits The course covers Multiple Access and Multiplexing Techniques; Spread spectrum and Code division multiple access (CDMA) techniques: Direct sequence, Frequency hopping; Multicarrier Techniques: Orthogonal frequency division (OFDM) and Multicarrier CDMA (MC-CDMA); New Wireless Communication Systems: Ultra Wideband communications, Wireless Fidelity (Wi-Fi), Radio Frequency Identification (RFID), Bluetooth, etc.

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6113 Signals, Systems and Transforms

Prerequisite(s): Graduate status.
Also listed under: BE 6403.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6303 Probability Theory

Prerequisite(s): Graduate status and MA 3012.
Also listed under: BE 6453.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6383 High-Speed Networks
This course covers the basics, architectures, protocols and technologies for high-speed networks. Topics: synchronous optical network (SONET), asynchronous transfer mode (ATM), ATM adaptation layer (AAL), 10/100/1000/10G Ethernet, Ethernet over SONET (EOS), quality of service control, packet scheduling, network processor, buffer management, flow and congestion control, TCP, high-speed TCP and XCP, Routing and IP fast rerouting, WDM networks, MPLS and GMPLS. Each student is required to complete a project that can be reading, software design or hardware design.

Prerequisite(s): Graduate status, EL 5363 or EE 136 or equivalent.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7133 Digital Signal Processing

This course addresses the basics, the theory, architectures and technologies to implement high-performance high-speed large-scale routers and switches. The fundamental concepts and technologies of packet forwarding, classification and switching learned in the class are useful and practical when designing IP routers, Ethernet switches and optical switches. Topics: IP Route Lookup, Packet Classification, Packet Scheduling, Buffer Management, Basics of Packet Switching, Output-buffered Switches, Shared-memory Switches, Crosspointbuffered Switches, Input-buffered Switches, Clos-network Switches, Multi-Stage Buffered Switches, Two-Stage Load-Balanced Switches, Optical Packet Switches and ASIC for IP Routers.

Prerequisite(s): EL 5363 or adviser approval.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7373 High Performance Switches and Routers

This course covers the basics, architectures, protocols and technologies for high-speed networks. Topics: synchronous optical network (SONET), asynchronous transfer mode (ATM), ATM adaptation layer (AAL), 10/100/1000/10G Ethernet, Ethernet over SONET (EOS), quality of service control, packet scheduling, network processor, buffer management, flow and congestion control, TCP, high-speed TCP and XCP, Routing and IP fast rerouting, WDM networks, MPLS and GMPLS. Each student is required to complete a project that can be reading, software design or hardware design.

Prerequisite(s): Graduate status, EL 5363 or EE 136 or equivalent.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Minimum Total: 30 Credits

Transportation Management, M.S.

Master of Science in Transportation Management
The program is for practicing professionals who deal with a public transit system, and agency and/or facility management. It combines basic management skills with a working knowledge of techniques and approaches to optimize transportation system results.

Goals and Objectives

The primary goal of the MS in Transportation Management is to prepare professionals to effectively and efficiently manage various transportation enterprises. The emphasis is on agencies, facilities and services in the public sector. Specific objectives of the program are to provide:

- a basic background in management skills and techniques, specifically as applied to public and private transportation organizations;
- basic understanding of the economic aspects of the transportation sector;
- an understanding of the importance of national, state and local transportation policy on public and private sector organizations;
- fundamental knowledge on some specific issues and problems in managing and operating public transportation facilities.

Program Requirements

Required Courses: 18 Credits

The following courses are required of all students:

**TR 6013 Fundamental Concepts in Transportation**

*3 Credits* This course provides the contextual foundations to study urban transportation systems, using performance criteria reflecting the perspectives of system providers/owners, users and communities. The connection between transportation supply, travel demand, service volume and level of service is explored and quantified for various travel modes. The impacts of transportation system performance on travel behavior, communities and the environment is discussed. The role of technology and institutions is examined with case examples.

Prerequisite(s): Graduate status or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 6213 Transportation Economics and Finance**

*3 Credits* This course provides the basic principles of engineering economic analysis and their application to transportation projects. Half of the course covers the concepts of present worth, capital recovery, sinking funds and annual cost applied to economic comparisons and evaluations of alternatives. The second half of the course delves into financing transportation and how government policy on transportation affects the economy and environs at the local, state and federal levels. Historical perspectives on the financing of highway systems, public transportation systems and transportation agencies are presented. Other subjects include privatization, innovative financing methods, business plans.

Prerequisite(s): TR 6013 or permission of adviser
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
TR 6223 Intelligent Transportation Systems and Their Applications

3 Credits This course introduces the concepts and applications of Intelligent Transportation Systems (ITS) and its growing role in the management of transportation systems. The course stresses the role of ITS as national policy, as specified in major transportation funding legislation – ISTEA, TEA21 and SAFETY-LU. A systems engineering approach to overall development of ITS technologies is stressed. Major components of ITS are discussed, and examples of their application treated. Coordination and integration of ITS components are treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7223 Management of Transit Maintenance and Operations

3 Credits This course provides a comprehensive understanding of modern public transportation systems, emphasizing their technology and operational practices. Planning and management aspects are also covered. Such operational management issues as maintenance practices, scheduling, procurement and labor relations are broadly outlined and discussed. Planning and capital programming issues are also treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7213 Transportation Management

3 Credits This course presents an overview of the transportation management profession. Levels of management and unique objectives of management in the transportation sector are presented and discussed. Management structures for private and public transportation organizations are analyzed. Management practices are treated from the perspective of organizations, optimization of the use of public resources, legislative and legal contexts and operations.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7133 Urban Public Transportation Systems

3 Credits This course provides a thorough understanding of policy, planning, operational and technical issues that affect urban public transportation. It includes the historical development of cities and the rise of urban transport. Also covered are the characteristics of various urban transportation modes (their specific operating and infrastructure characteristics), as well as key elements that are critical to service provision, such as service planning, scheduling, fare collection, communication and signaling, station design and customer service. The course offers a broad perspective on regional planning, capital programming and policy matters. Special focus will be on emerging technologies and their practical applications.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Electives: 12 Credits

Students will take elective courses in the following areas:
Transportation Planning and Engineering, M.S.

Master of Science in Transportation Planning and Engineering

The MS program has a strong foundation in traffic engineering, transportation planning, transportation economics, public transportation systems and intelligent transportation systems. Students are exposed to a learning atmosphere that provides a meaningful combination of theoretical and practical approaches. Courses include a mix of presentations, workshop and project exercises, and practical problem solutions.

The program focuses on (1) material suited to the issues and projects students will face on the job, so that they are immediately productive; (2) material packaged by the course so that each course provides specific skills and knowledge, enabling the student to be immediately productive; (3) project-based learning in multiple courses, as an underlying approach to teaching the courses and the program; (4) modern tools integrated into the courses, including, but not limited to: Synchro and SIM-Traffic and other simulation programs, HCS+, AutoCAD templates for intersection design, and data collection and processing software; (5) design problems taught through a project/case studies approach; (6) statistics integrated into courses, with moderately advanced skills in Excel and Word expected in all courses (but not explicitly taught).

The program includes a strong focus on the rapidly emerging field of intelligent transportation systems. This field applies telecommunications and information technology to solving a variety of transportation functions, from route guidance systems to automated toll collection systems to the automated highway.

Goals and Objectives

The primary goal of the MS in Transportation Planning and Engineering is to prepare transportation professionals to plan, functionally design, control and operate facilities, systems and services that satisfy the demand for passenger and freight transportation. Specific objectives of the program are to provide the skills necessary to:

- Fundamentally understand the nature and generation of transportation demands;
- Understand the political, policy and economic forces that affect transportation demands and the public framework in which they are addressed;
- Functionally design transportation systems and components;
- Control and operate traffic and other transportation facilities; and
- Apply information technologies to intelligent transportation systems.

Program Requirements

Required Courses: 18 Credits

TR 6013 Fundamental Concepts in Transportation
This course provides the contextual foundations to study urban transportation systems, using performance criteria reflecting the perspectives of system providers/owners, users and communities. The connection between transportation supply, travel demand, service volume and level of service is explored and quantified for various travel modes. The impacts of transportation system performance on travel behavior, communities and the environment is discussed. The role of technology and institutions is examined with case examples.

**Prerequisite(s):** Graduate status or permission of instructor.

**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

**TR 6113 Forecasting Urban Travel Demand**

3 Credits The purpose of this course is to study methods and models used in estimating and forecasting person travel in urban areas. The objective is to understand the fundamental relationships between land use, transportation level of service and travel demand, and to apply methods and state-of-the-practice models for predicting person travel on the transportation system.

**Pre/Co-requisite:** TR 6013 or permission of instructor.

**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

**TR 6313 Traffic Control and Signalization I**

3 Credits Traffic controls are imposed to provide for safe, efficient and orderly movement of people and goods on our nation’s street and highway systems. Traffic control is examined in the urban context in which both vehicles and pedestrians be accommodated. Techniques for quantifying traffic stream behavior are described. Federal, state and local standards for designing and implementing control devices are presented. Selection of control measures, design and timing of traffic signals at individual intersections and in arterial networks is treated in detail. Use and application of current computer tools – HCS++ and Synchro – are illustrated.

**Prerequisite(s):** TR 6013 or permission of instructor.

**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

**TR 6323 Traffic Control and Signalization II**

3 Credits In furtherance of the material covered in TR 6313, emphasis is on the arterial as a facility and on systems concepts such as traffic calming, access management and roundabouts as a design element. Also covered are network problems induced by traffic congestion and remedies such as critical intersection control, network metering, oversaturated control policies and real time sensing, and traffic impacts from growth and development, including assessment and mitigation. The course employs the use of modern tools, including VISSIM, Synchro/SIMTraffic and HCS++, and two projects must be completed by students working in teams. This course should be taken in the student’s last or penultimate semester.

**Prerequisite(s):** TR 6313 or equivalent and TR 6113 or equivalent.

**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

**TR 6213 Transportation Economics and Finance**

3 Credits This course provides the basic principles of engineering economic analysis and their application to transportation projects. Half of the course covers the concepts of present worth, capital recovery, sinking funds and annual cost applied to economic comparisons and evaluations of alternatives. The second half of the course delves into financing transportation and how government policy on transportation affects the economy and environs at the local, state and federal levels. Historical
perspectives on the financing of highway systems, public transportation systems and transportation agencies are presented. Other subjects include privatization, innovative financing methods, business plans.

*Prerequisite(s): TR 6013 or permission of adviser*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 6223 Intelligent Transportation Systems and Their Applications**

3 Credits This course introduces the concepts and applications of Intelligent Transportation Systems (ITS) and its growing role in the management of transportation systems. The course stresses the role of ITS as national policy, as specified in major transportation funding legislation – ISTE, TEA21 and SAFETY-LU. A systems engineering approach to overall development of ITS technologies is stressed. Major components of ITS are discussed, and examples of their application treated. Coordination and integration of ITS components are treated.

*Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Electives: 9-12 Credits**

Additionally all students would select 9 to 12 credits from the following list of electives:

**TR 6023 Analytic Methods in Transportation**

3 Credits This course introduces transportation students to a variety of analytic techniques as they are commonly applied to transportation issues. The course covers basic statistics and statistical analyses and their application to transportation studies, including traffic characteristics studies and survey instruments. Mathematical techniques for analyzing transportation queues are covered. Statistical tests for significance of improvement impacts are illustrated. Regression analysis applied to developing transportation models is covered. An introduction into traffic simulation is also given.

*Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 7123 Transportation Planning and Congestion Management**

3 Credits This course provides a contextual understanding of urban transportation planning and its component activities. It helps students understand the enabling environment needed to sustain the planning process; to understand the causes of transportation congestion and its impacts on transportation users and communities; to set forth a vision for congestion management; and to develop and evaluate strategies and policies that achieve the vision.

*Pre/Co-requisite: TR 6013 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 7133 Urban Public Transportation Systems**

3 Credits This course provides a thorough understanding of policy, planning, operational and technical issues that affect urban public transportation. It includes the historical development of cites and the rise of urban transport. Also covered are the characteristics of various urban transportation modes (their specific operating and infrastructure characteristics), as well as key elements that are critical to service provision, such as service planning, scheduling, fare collection, communication and signaling,
station design and customer service. The course offers a broad perspective on regional planning, capital programming and policy matters. Special focus will be on emerging technologies and their practical applications.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7323 Design of Parking and Terminal Facilities

3 Credits This course covers design techniques and approaches to a variety of pedestrian and vehicular needs in conjunction with access to land functions. Parking serves as the primary access interface to many land facilities, from shopping centers and sports facilities, to medium- and high-density residential developments. The planning and design of parking facilities, and the planning of access and egress from these facilities, is critical to the economic success of a development. Terminals are inter-modal interface facilities involving the transfer of people and/or goods from one mode of transportation to another. This course covers essential elements of terminal planning and design, including transit stations and terminals, major goods terminals at ports and railheads and others. The design of pedestrian space and ways within terminal structures is also treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7033 Transportation Safety and Security

3 Credits Technology, legislation and market forces have contributed to improved transportation safety for decades. But one must consider which metrics are most relevant for which modes, the role of demographics and traffic levels and other factors when analyzing and predicting safety trends. The course pays attention to a systems view, to metrics by mode and to both standard field and statistical analyses. Consistent with current priorities, the course addresses security as well as safety issues.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

• TR 7233 Transportation Management 3 Credits

TR 7243 Intelligent Transportation Systems: Deployments and Technologies

3 Credits Transportation infrastructure deploys a wide range of modern technology to provide service to travelers, the general public and private entities. This technology enables other systems to function effectively and serve societal needs. This course focuses on data communications and applications in intelligent transportation systems: communications alternatives and analyses, emerging technologies, geographic information systems (GIS) and global positioning systems (GPS).

Prerequisite(s): TR 6223 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7343 Urban Freeways and Intercity Highways

3 Credits This course focuses on the design, analysis, control and management of urban freeways and intercity highways of all classes. The course covers geometric design standards and principals, the application of highway capacity and level of service analysis methodologies (including HCS++), marking and signing, speed control and modern freeway management systems and approaches.
Prerequisite(s): TR 6013, TR 6313, or equivalents, or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 8013 Selected Topics in Transportation I

3 Credits These courses are given as needed to present material on current topical subjects that are not expected to be given on a regular basis. The topic(s) for each offering are indicated and are listed on the student’s transcript. These courses may be taken more than once if the listed topics are different.

Prerequisite(s): TR 6013 Fundamental Concepts in Transportation and as approved for the topic(s); to be specified for each offering.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

or

TR 8023 Selected Topics in Transportation II

3 Credits These courses are given as needed to present material on current topical subjects that are not expected to be given on a regular basis. The topic(s) for each offering are indicated and are listed on the student’s transcript. These courses may be taken more than once if the listed topics are different.

Prerequisite(s): TR 6013 Fundamental Concepts in Transportation and as approved for the topic(s); to be specified for each offering.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 900x Readings in Transportation

Variable Credits This is an individually guided effort involving research into a topic of interest, usually growing from a course the student has taken. Readings courses should not duplicate material available in a regularly scheduled course, but should involve additional research on a topic or topics of interest to the student that is related to a course or courses. A formal written report is required. The student must have a faculty adviser who agrees to work with them and an agreed-upon topic before registering. The student may register for 1 to 3 credits for a readings effort, in proportion to the effort and as approved by the supervising instructor.

Prerequisite(s): Permission of supervising instructor.

TR 997X MS Thesis in Transportation

3 Each Credits Students electing to take a 6-credit MS Thesis commit to a significant individually guided research effort, resulting in a formally defended thesis report, bound in accordance with Institute requirements.

Prerequisite(s): MS degree status and permission of thesis adviser.

Note:

MS students in the Transportation Planning and Engineering program may take 3 credits of free electives from any graduate course offering at Polytechnic, assuming that the student has the necessary prerequisites. Adviser approval is required for all elective selections.
Urban Systems Engineering and Management, M.S.

Requirements for the Master of Science

Program Core: 15 Credits

All students must complete the following five courses:

**CE 7813 Infrastructure Planning, Engineering and Economics**

*3 Credits* This course covers methods for identifying, formulating, preliminarily appraising and analyzing in detail individual projects and systems of civil engineering projects. Different approaches relevant to government agencies, public utilities, industrial firms and private entrepreneurs are discussed, as well as planning of projects to satisfy single and multiple purposes and objectives, meet local and regional needs and take advantage of opportunities for development. Also covered are financial and economic analyses, including sensitivity and risk analysis; mathematical models for evaluation of alternatives and optimization; and environmental, social, regional economic growth, legal and institutional and public involvement impacts of projects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7843 Introduction to Urban Systems Engineering**

*3 Credits* This course provides a descriptive overview of key infrastructure systems and technologies that must be managed, operated and maintained. Systems treated include buildings and structures, water supply, solid and liquid waste handling and disposal, transportation, power, communications and information systems, health and hospitals, police and preprotection. The course explores the financial, political, administrative, legal and institutional settings of these systems and technologies. A portion of the course features distinguished guest lecturers who are experts in some of the systems and technologies included.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7853 Concepts and Implementation of Infrastructure Management Systems**

*3 Credits* This course reviews state-of-the-art, performance monitoring and system-condition assessment methodologies as part of infrastructure management systems. Emphasis is on information technologies as applied to remote sensing and database development for urban systems management. Tools, such as GIS and dedicated databases for condition assessment are presented in a laboratory environment. Invited experts participate in such areas as transportation, water distribution and utilities.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7673 Environmental Impact Assessment**

*3 Credits* This course examines legal and technical requirements in preparing environmental impact statements. Considerations include legal and technical requirements, the procedure and the interdisciplinary nature of the analysis. Topics include overall impact evaluation, categories of impacts, problem definition, quantification of impact, methods used in analysis, field
evaluations, mitigations, hearing procedures and management. Practical examples and case studies are used.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8733 Infrastructure Financing: Structuring of a Deal**

*3 Credits* This course examines what it takes to structure a deal from a credit perspective, legally and financially, for domestic and international projects. In the domestic sector, the course focuses on transportation projects, examining the peculiarities and the uniqueness of the capital market. Examples are studied and recent changes are discussed in areas such as financing transportation projects and the dramatically changing nature of financing these projects. In the international sector, the course covers innovative financing techniques.

*Prerequisite(s):* Admission to the Exec 21 Program or permission of a Construction Management Program Director.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Note:**

*Course is part of the Exec 21 program; special requirements (see Construction Management Program) or permission of adviser required.*

**Minor, Technical and Free Electives:**

Each minor area of study includes: (1) three minor courses, required for the minor; and (2) two to three technical electives, available to all program students.

Students may elect not to take a specified minor area. They may, instead, take five or six technical electives from the approved list in any specified area. The number of technical electives is influenced by whether the student elects to do a 3-credit case study report or a 6-credit MS thesis, as described in a later section.

**Minor Areas of Concentration**

- Transportation Systems Management (TSM)
- Construction Management (CM)
- Environmental Systems Management (ESM)
- Civil Infrastructure Systems Management (CISM)

Because of course content, students selecting the CISM minor should hold a BS in Civil Engineering or the equivalent.

**Minor in Transportation Systems Management**

Credits required in the minor:

**TR 7223 Management of Transit Maintenance and Operations**

*3 Credits* This course provides a comprehensive understanding of modern public transportation systems, emphasizing their technology and operational practices. Planning and management aspects are also covered. Such operational management issues as maintenance practices, scheduling, procurement and labor relations are broadly outlined and discussed. Planning and capital programming issues are also treated.
Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 6223 Intelligent Transportation Systems and Their Applications

3 Credits  This course introduces the concepts and applications of Intelligent Transportation Systems (ITS) and its growing role in the management of transportation systems. The course stresses the role of ITS as national policy, as specified in major transportation funding legislation – ISTEA, TEA21 and SAFETY-LU. A systems engineering approach to overall development of ITS technologies is stressed. Major components of ITS are discussed, and examples of their application treated. Coordination and integration of ITS components are treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7133 Urban Public Transportation Systems

3 Credits  This course provides a thorough understanding of policy, planning, operational and technical issues that affect urban public transportation. It includes the historical development of cities and the rise of urban transport. Also covered are the characteristics of various urban transportation modes (their specific operating and infrastructure characteristics), as well as key elements that are critical to service provision, such as service planning, scheduling, fare collection, communication and signaling, station design and customer service. The course offers a broad perspective on regional planning, capital programming and policy matters. Special focus will be on emerging technologies and their practical applications.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Approved Technical Electives in Transportation

- TR 6133 Travel Demand Forecasting 3 Credits

TR 7123 Transportation Planning and Congestion Management

3 Credits  This course provides a contextual understanding of urban transportation planning and its component activities. It helps students understand the enabling environment needed to sustain the planning process; to understand the causes of transportation congestion and its impacts on transportation users and communities; to set forth a vision for congestion management; and to develop and evaluate strategies and policies that achieve the vision.

Pre/Co-requisite: TR 6013 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 6213 Transportation Economics and Finance

3 Credits  This course provides the basic principles of engineering economic analysis and their application to transportation projects. Half of the course covers the concepts of present worth, capital recovery, sinking funds and annual cost applied to economic comparisons and evaluations of alternatives. The second half of the course delves into financing transportation and how government policy on transportation affects the economy and environs at the local, state and federal levels. Historical
perspectives on the financing of highway systems, public transportation systems and transportation agencies are presented. Other subjects include privatization, innovative financing methods, business plans.

Prerequisite(s): TR 6013 or permission of adviser
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:
Additional electives may be approved by the adviser.

Minor in Construction Management

Required in Minor:

CE 8253 Project Management for Construction

3 Credits This course covers topics specific to developing and coordinating large projects, including organizational structures, management functions, pricing and estimating project costs, bidding and contracting, risk allocation, scheduling, time and cost control, labor relations, quality management and project life-cycle activities.

Also listed under: MG 8253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8713 Construction and the Law

3 Credits Construction industry executives need not be legal experts, but they must be aware of the legal issues affecting their industry and their bottom line. This course uses the case study method to lead students through the concepts of design and construction law. The course focuses on the interface of legal, business and technical issues and their resolution. It includes the design and organization of construction documents; the legal aspects of bidding, subcontracting, bonds, insurance, mechanic’s liens, etc; and the implication of delays, changes and charged conditions. Alternative dispute resolution (ADR) methods are introduced.

Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8723 How to Succeed in Construction

3 Credits This course leads students through the how-to’s of running a successful, large, complex construction company. It analyzes how the industry actually works, including contractual relationships with clients in all types of projects from design/build to privatization. It covers the business fundamentals of running a construction company, including issues such as surety and insurance; various types of construction organizations, domestic and international; and company culture – inner-workings of a business that can mean the differences between success and failure.

Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:
Approved Technical Electives in Construction:

**CE 8273 Contracts and Specifications**

3 Credits This course covers principles of contract law as applied to the construction industry and legal problems in preparing and administering construction contracts.

*Also listed under: MG 8273.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8783 Construction Management and Planning**

3 Credits Strategic planning is indispensable to achieving superior management. This course in business planning provides practical advice for organizing the planning system, acquiring and using information and translating strategic plans into decisive action. This knowledge is an invaluable resource for top and middle-level executives.

*Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8703 Managing and Leading in the 21st Century**

3 Credits Today’s mega projects require the formation of large multidisciplinary teams including engineers, constructors and financial, legal and business experts. Success in this challenging environment requires up-to-date and proven leadership and management skills. This course covers the basic components of management planning, organizing, directing, controlling and decision-making. It defines the engineering and construction team and discusses leadership styles. This course also addresses the management of change, external factors that shape decisions, the development of personal leadership abilities and, ultimately, 21st century leadership requirements.

*Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Note:**

Additional electives may be approved by the adviser.

*Course is part of the Exec 21 program; special requirements (see Construction Management Program) or permission of adviser required.*

**Minor in Environmental Systems Management**

Credits required in the minor:

**CE 7753 Environmental Systems Management**
This course provides an overview of information technologies as applied to the remote sensing of environmental infrastructure systems, and includes the development of infrastructure system databases to assist complex decision-making on environmental infrastructures.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7533 Hazardous/Toxic Waste Management**

This course looks at methods in the management of hazardous/toxic waste sites. Topics covered include health and safety, legal aspects, contamination of the environment, treatment processes and toxicology and risk assessment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7563 Environmental Law**

This course presents legal principles and issues relating to environmental law. Historical perspectives and case laws will be considered. Topics include the Clean Water Act, nonpoint sources and water quality laws, the Clean Air Act and its amendments, the National Ambient Air Quality Standards and the National Environmental Policy Act. The above legislation and its impact on policy and technology also will be considered.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Approved Technical Electives in Environmental Studies:

**CE 7473 Analysis of Stream and Estuary Pollution**

This course covers dispersal and decay of contaminants introduced into lakes, streams, estuaries and oceans, and the effects of pollutants on chemical quality and ecology of receiving waters.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7523 Air Pollution**

This course discussed the causes and effects of air pollution, methods of sampling, interpretation of data, meteorological aspects and methods of air-pollution control.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7543 Site Remediation**

This course covers: treatment and disposal technologies for hazardous waste site remediation; in-situ and ex-situ processes; physicochemical processes, stabilization and solidification; biological processes, including aerobic and anaerobic systems for degradation and detoxification; thermal processes and incineration; and storage, land disposal and containment. Remediation planning and technology selection for hazardous waste containment and clean up for typical case studies are
examined. The study of decision-making and technology selection is a key course component.

Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:
Additional electives may be approved by the adviser.

Minor in Civil Infrastructure Systems Management

Credits required in the minor:

CE 7863 Infrastructure Monitoring and Performance Assessment

3 Credits This course introduces the physical nature of infrastructure materials and systems. The concept of performance is introduced from the viewpoint of strength and durability. Lectures and laboratory demonstrations identify the mechanisms of degradation and cover techniques for condition assessment and quality assurance.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6063 Bridge Engineering

3 Credits This course covers types of bridges; geometric design of bridges; construction materials and techniques; simplified bridge analysis; special problems in the design of steel and reinforced-concrete bridges; bridge inspection policies; bridge rehabilitation procedures; bridge management systems; and the effects of wind and earthquakes on long-span bridges.

Prerequisite(s): Undergraduate structural analysis and steel design.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8433 Urban Geotechnology

3 Credits This course looks at case histories on geotechnical design, construction and rehabilitation in the urban environment. Topics covered: Special construction problems and innovative solutions; unforeseen ground conditions performance monitoring; remedial planning and implementation; and geotechnical design and construction issues from a practicing engineer’s perspective.

Prerequisite(s): CE 3153 and CE 4173 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Approved Technical Electives in Infrastructure Systems:

CE 6143 Steel Structures

3 Credits This course explores compression members; elastic and inelastic buckling of columns and plates; lateral support of beams; torsion of open and closed sections; warping; lateral torsional buckling of beams; and bi-axial bending. Other topics
include: Plate girders, including stability of webs and flanges; combined bending and axial load; instability analysis; and design
of rigid and semi-rigid mechanisms of continuous beams and rigid frames. Both elastic and plastic design criteria are discussed.

Prerequisite(s): CE 3143 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8433 Urban Geotechnology

3 Credits This course looks at case histories on geotechnical design, construction and rehabilitation in the urban environment.
Topics covered: Special construction problems and innovative solutions; unforeseen ground conditions performance monitoring;
remedial planning and implementation; and geotechnical design and construction issues from a practicing engineer’s perspective.

Prerequisite(s): CE 3153 and CE 4173 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8493 Environmental Geotechnology

3 Credits This course covers: Clay mineralogy; soil water interaction processes; chemical transport through soils; hydraulic
conductivity, diffusion and attenuation mechanisms; water-disposal systems; design of land-fills, seepage barriers and cut-off
walls; geo-environmental site characterization techniques; and soil remediation techniques.

Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

Additional electives may be approved by the adviser.

Capstone Experience

Students fulfill the requirement for a meaningful Capstone experience by completing an independent case study in urban systems
management and engineering (3 credits) or a master’s thesis on a topic of independent study (6 credits).

All course descriptions for Urban Systems Engineering and Management are found in the Civil Engineering section of this
catalog.

Doctor of Philosophy

Chemical Engineering, Ph.D.

Requirements for the Doctor of Philosophy in Chemical Engineering

Students must pass a comprehensive qualifying examination in chemical engineering and present a doctoral dissertation. The
qualifying exam is given once a year. Additional details on the qualifying examination should be obtained from the graduate
adviser. Each doctoral candidate must complete a minimum of 75 credits of academic work past the bachelor’s degree, including a minimum of 45 credits of dissertation research. Although the student may elect to take more than 45 credits of PhD thesis, only 45 of those credits can be counted in the required 75 credits. Furthermore, of those 45 credits, at least 36 must be taken beyond MS thesis and at NYU-Poly. A minimum of 30 graduate credits beyond the bachelor’s degree (not including PhD or MS thesis credits) are required in chemical engineering subjects and related subjects, of which at least 12 must be taken at NYU-Poly. Attendance is required at departmental seminars for at least four semesters.

To meet graduation requirements, students must have an overall B average in all courses, excluding thesis, and must not obtain more than two grades of C in required subjects. Candidates for the degree Doctor of Philosophy in Chemical Engineering should plan their programs in accordance with the following requirements:

Required Subjects: 12 credits, 3 credits each

**CBE 6153 Applied Mathematics in Engineering**

*3 Credits* This course covers mathematical formulation of chemical engineering problems in terms of ordinary and partial differential equations. Topics include solutions of boundary and initial value problems using Green’s functions and other techniques; characterization of second-order partial differential equations and properties of their solutions; asymptotic methods and numerical techniques.

*Prerequisite(s):* MA 2122 and MA 2132 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CBE 6333 Transport Phenomena**

*3 Credits* The topics in this course include vector analysis review; diffusive fluxes; conservation equations for chemical species and thermal energy; boundary conditions; scaling and approximation techniques; solution methods for conduction and diffusion problems; transient unidirectional diffusion and conduction; momentum diffusion and viscous stress; conservation equation for momentum and the Navier-Stokes equations; unidirectional and lubrication flows; and low-Reynolds and high-Reynolds number flows.

*Prerequisite(s):* CBE 3313 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CBE 6733 Chemical Engineering Thermodynamics**

*3 Credits* This course covers advanced treatment of phase and chemical equilibria; ideal and nonideal solutions; stability of thermodynamic systems; osmotic pressures; electrolyte solutions; solid-liquid equilibria; and biochemical applications.

*Prerequisite(s):* CBE 3153 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CBE 6813 Chemical Reactor Analysis and Design**

*3 Credits* The topics in this course include trends and issues in modern reactor design; kinetics of complex homogenous and heterogeneous reactions; determination of nonlinear kinetic parameters, effects of transport processes, and catalyst deactivation; analysis and design of reactors; laminar flow reactors; dispersion model; split boundary condition problems; effects of non-ideal
flow on conversion; and fixed-bed, fluidized-bed and multiphase reactors.

Prerequisite(s): CBE 3223 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 9910 Seminar in Chemical and Biomolecular Engineering

0 Credits Recent developments in chemical and biomolecular sciences and engineering are presented by engineers and scientists from industry and academia.

Note: Four semesters are required for PhD candidates.

CBE 9920 Seminar in Chemical and Biomolecular Engineering

0 Credits Recent developments in chemical and biomolecular sciences and engineering are presented by engineers and scientists from industry and academia.

Note: Four semesters are required for PhD candidates.

Electives: 18 Credits

At least three electives (9 credits) must be chosen from CBE 6003-CBE 9413.

The remaining courses may be chosen from other graduate programs with the approval of the graduate adviser in chemical engineering.

Thesis: 45 Credits

CBE 999X PhD Dissertation in Chemical & Biological Engineering

(45 credits total, each 3 credits) Credits Theses for the PhD degree must give results of independent investigations of problems in chemical engineering and may involve experimental or theoretical work. Theses must show ability to do creative work and must show that original contributions, worthy of publication in recognized journals, are made to chemical engineering. Candidates are required to take oral examinations on thesis subjects and related topics. Doctoral-degree candidates must submit five unbound thesis copies to advisers before or on the seventh Wednesday before commencement.

Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam, graduate standing, and dissertation advisor approval

Note:

Up to 9 credits of Master’s Thesis can be included here.

Total: 75 Credits
Note:

* CBE 9910/CBE 9920 must be taken for two years.

Civil Engineering, Ph.D.

Doctoral Program in Civil Engineering

The Department of Civil Engineering currently offers two doctoral degree programs: PhD in Civil Engineering and PhD Transportation Planning and Engineering. Requirements for the Civil Engineering degree are detailed here. For information on the Transportation Planning and Engineering program, see the “Transportation” section of this catalog.

Goals and Objectives

The PhD in Civil Engineering is research-oriented and intended for those whose goal is a career in civil engineering research and/or teaching at the university level or in private research organizations. Specific doctoral program objectives are to develop the skills and knowledge necessary to:

- Specialize within one of the subdisciplines of civil engineering;
- Perform independent fundamental research in one of the subdisciplines of civil engineering;
- Produce a piece of fundamental research that advances meaningfully the state of the art of one of the subdisciplines of civil engineering and is publishable in a first-tier refereed civil engineering-related journal.

A PhD is granted for the invention or creation of new knowledge in civil engineering. This knowledge may result from analytical, numerical or experimental research. The knowledge may be practical or fundamental in nature.

Areas of Concentration

Students pursuing the PhD in Civil Engineering must choose to specialize in one of the following subdisciplines of civil engineering:

- Structural Materials and Engineering
- Geotechnical and Geo-environmental Engineering
- Environmental and Water Resources Engineering
- Construction Management and Engineering
- Highway and Traffic Engineering
- Urban Infrastructure Systems Engineering and Management

Other focus areas are possible and can be developed with the assistance of faculty advisers. All subject areas must be relevant to the degree sought, and a faculty member must be willing and able to guide the student’s research.

Program Administration

The Department of Civil Engineering has five graduate program coordinators:
Admission Criteria

1. Admission to the PhD in Civil Engineering requires an MS in Civil Engineering or equivalent with a GPA of 3.5 or better (on a 0-4 scale).
2. Applicants to the PhD programs are not required to take the Graduate Record Examination (GRE); however, it is encouraged. If the GRE is taken, the applicant must submit the results for consideration.
3. Foreign applicants must take the TOEFL examination and submit the results for consideration.

In criteria 1 and 2 above, the “equivalent” can be achieved in several ways. The candidate may have a MS degree with a different title that covers substantially the same material. In more general terms, the applicant must demonstrate that he or she has the equivalent of all undergraduate and master’s-level course work to be able to pursue doctoral-level work in the chosen major area, as well as in a minor area within the umbrella of civil engineering. Further, “equivalence” is evaluated based on the totality of the student’s undergraduate and graduate record, not course by course. Thus, an applicant who wishes to pursue doctoral work in Environmental Engineering, for example, must have the entire undergraduate and master’s-level course background expected in Environmental Engineering, but need not demonstrate such a background in structures. Because admission to a PhD program requires a relevant MS (or equivalent), an applicants who has not yet earned a master’s degree will be admitted as MS students and is expected to earn a MS degree while completing the major and minor course requirements. In rare cases, an applicant with only a BS degree may be directly admitted into the PhD program with the written approval of the department head.

Doctoral Program of Study

Every PhD student upon admission is assigned an academic adviser, who is designated by the department head. Any member of the civil engineering faculty may be an academic adviser to a PhD student. The first meeting should take place shortly after receiving an acceptance letter from the Admissions Office. During this first meeting the student’s Program of Study should be established. The Program of Study should include a list of the fundamental and advanced topics that will comprise the specific courses, the subject matter for the qualifying exam and possible research areas.

In cases where a student is supported on a research contract, the principal investigator of the contract will normally be the student’s academic adviser. Where a student has a particular research interest and is working with a particular faculty member, the student may request that faculty member for his or her academic adviser. In rare cases, when a PhD student enters the program without a prior selection of a major area of study, the initial academic adviser will be the graduate coordinator of the program area. Each PhD candidate reports to two advisory committees: an Academic Advisory Committee and a Dissertation Committee.

Academic Advisory Committee

The student’s academic adviser plans a program to fulfill major and minor requirements for the PhD degree. The Academic Advisory Committee generally consists of the academic adviser and one faculty member for each minor area of study. The Academic Advisory Committee guides the PhD student’s work through the successful completion of a qualifying examination. A letter signed by the academic adviser and approved by the department head is placed in the student’s file indicating the composition of the Academic Advisory Committee.
**Doctoral Degree Requirements**

To earn a doctoral degree in Civil Engineering, the following requirements must be met:

1. 54 credits of graduate course work (not including the PhD dissertation) in relevant major and minor areas of study beyond the bachelor’s degree, with an average grade of B or better (cumulative average of 3.0 or better on a 0-4 scale). Up to 6 credits of the 54 credits may be satisfied by individual guided studies, readings, projects and theses.
2. Completion and successful defense of a 21-credit dissertation related to the major area of study. Dissertations must consist of original research that meaningfully advances the state of the art in the research subject area and should result in the publication of at least one paper in a strictly peer-reviewed technical journal related to the subject. A grade of B or better must be achieved for the dissertation. There are two types of dissertation credits:
   - CE 9998: Independent original investigation demonstrating creativity and scholarship worthy of publication in a recognized engineering journal. Registration for a minimum of 6 credits is required before registering for CE 999X.
   - CE 999X: Independent original investigation demonstrating creativity and scholarship worthy of publication in a recognized engineering journal. Candidates must successfully defend dissertations orally. Registration for 3 to 6 credits per semester is permitted after successfully completing the doctoral qualifying examination, but a minimum of 12 credits must be completed before the defense. Registration must be continuous (excluding summer semesters), unless a formal leave of absence is requested and approved. Registration for 3 to 12 credits per semester is permitted. In the final semester of work, registration for credit is permitted with the approval of the department head. Prerequisites: CE 9998 (6 credits), degree status, successful completion of doctoral qualifying examinations and approval of the dissertation adviser.
3. Completion of two minor areas of study, as follows:
   - Out of Department Minor: Completion of 9 credits of graduate or undergraduate course work in one or two technical areas of study.
   - In-Department Minor: Completion of 6 credits of graduate course work in a minor area outside the major subdiscipline in civil engineering.
4. Residency requirements for the PhD in Civil Engineering include the 21-credit dissertation plus a minimum of 15 credits of applicable graduate course work taken at NYU-Poly.
5. In satisfying the 54-credit course requirement (requirement 1), the student must satisfy all requirements for the major and minor areas selected, or their equivalents.
6. In satisfying these basic PhD requirements, students also must satisfy one of the two following conditions:
   a. 48 credits of relevant graduate course work, not including individual guided studies (readings, projects, theses, etc.) beyond the bachelor’s degree, with an average grade of B or better (cumulative average of 3.0 or better on a 0-4 scale).
   b. 24 credits of approved graduate course work, not including individual guided studies (readings, projects and theses) beyond the master’s degree, with an average grade of B or better (cumulative average of 3.0 or better on a 0-4 scale). Satisfying condition 2 requires that the department accept the student’s MS degree in toto without regard to its specific content. This acceptance requires a recommendation from the department’s Graduate Committee and department head approval.

2. Although publication is not required as a condition for graduation at this time, journal publication is strongly encouraged. Every PhD candidate is expected to generate knowledge worthy of publication in two or more reputable journals.

**Transfer Credits**

A maximum of 39 credits of approved graduate work may be transferred. Transfer credits for PhD students may be awarded on a course-by-course basis or by the transfer of a MS degree from another institution in satisfaction of 30 graduate credits. The latter requires a recommendation from the department’s Graduate Committee and the approval of the department head. Transfer credits are generally awarded at the time of admission and must be approved by the academic adviser, the graduate coordinator and the department head.
Qualifying Examinations

A student must register for RE 9990 PhD Examination in the semester in which the qualifying exam will be taken. This course carries no credit, and the student incurs no fees. It provides a place in the student's official transcript to record when the qualifying exam was taken and the result.

Every student pursuing a PhD must pass a qualifying examination before becoming a candidate for the PhD. The qualifying examination consists of a six-hour written portion (generally given in two three-hour blocks on the same day), and an oral portion which may be given before or after the written portion. Both written and oral portions focus on fundamental and advanced civil engineering topics relevant to the student’s specific program of study.

The oral portion may also explore specific skill areas required to conduct successful independent research. Students are deemed to have passed the examination based upon an overall evaluation of both the written and oral portions of the examination.

The qualifying examination is a pass/fail milestone in the PhD process. A letter indicating the result of each examination is placed in the student’s graduate file. In rare cases, a student may be deemed to have conditionally passed the qualifying exam. This may occur when the student does extremely well in all but one area. Such a student must follow a prescribed plan to strengthen his or her knowledge and skills in the weak area and pass a special examination in the weak area within one calendar year. A student who conditionally passes the qualifying exam may register for dissertation credits and may form a Dissertation Committee.

While each student will take a different qualifying examination based upon an individual program of study, the exam is considered a departmental examination. All department faculty members in each civil engineering sub-discipline may participate in submitting written problems. Each student’s academic advisory committee will review the entire exam before it is administered, and may suggest changes if it deems the examination, as presented, to be an inequitable test of the student’s abilities. Recommendations on examination results are submitted by each student’s Academic Advisory Committee. The departmental faculty, acting as a whole, votes to accept or reject such recommendations at a meeting scheduled for this purpose. Additionally:

1. According to NYU-Poly policy, students should take the qualifying exam within their first year of study at NYU-Poly.
2. A student may take the qualifying exam twice. A third attempt is permitted only with written permission from the Academic Advisory Committee and the approval of the department head. Under no circumstances may a student take the examination more than three times.
3. No student may register for CE 999X Dissertation credits until passing the qualifying exam.
4. A Dissertation Committee cannot be formed until the student passes the qualifying exam.
5. Any student who cannot pass the qualifying exam will be disqualified from the program.

Dissertation Committee

A Dissertation Committee is formed immediately after a student passes the qualifying exam to guide the student's course of study and research work. This committee will serve as a panel of experts to aid the candidate throughout his or her research.

The Dissertation Committee shall have no less than five members, including a chairperson, a major adviser, and an adviser for each minor the student is pursuing, one of whom must be on the faculty in another NYU-Poly department. One external member who is either a faculty member at another academic institution or a noted PhD-level practitioner is encouraged. Additional faculty members may also serve on the Dissertation Committee.

The members of the Academic Advisory Committee may also serve on the Dissertation Committee. The membership of the Dissertation Committee must be approved by the department head and recorded with the Office of Graduate Academics.

The major adviser, who may also serve as chairperson, must be a full-time faculty member of the Department of Civil Engineering.
Dissertation Proposal

Upon passing the qualifying exam and the appointment of a Dissertation Committee, the PhD candidate must submit a written Dissertation Proposal outlining the subject of the proposed research. This proposal should be 15 to 20 pages long and should address the following specific items:

1. Description of the topic;
2. Literature review sufficient to ensure original work;
3. Method(s) for the research;
4. Data and/or laboratory needs and their availability; and
5. Anticipated outcomes.

Dissertation Committee

The Dissertation Proposal must be submitted within one semester of full-time study after passing the qualifying exam, or before 9 credits of dissertation credit are completed.

The Dissertation Proposal is presented orally and defended before the Dissertation Committee and other interested departmental faculty. The date of the oral defense and copies of the draft Dissertation Proposal must be available to departmental faculty at least two weeks (14 calendar days) before the defense.

When the Dissertation Proposal is formally accepted and defended successfully, the chairperson of the Dissertation Committee shall enter a letter into the student’s graduate file, indicating this acceptance, together with a copy of the Dissertation Proposal. While the Dissertation Committee has reasonable flexibility to modify the Dissertation Proposal during the research, any significant change in focus area or methodology requires submission of an amended Dissertation Proposal and formal acceptance as described herein.

Dissertation Defense

The culmination of the student’s PhD work is the oral presentation and defense of the final draft dissertation. A defense is generally scheduled after the Dissertation Committee reviews the draft dissertation and determines that it is complete and of sufficient quality to be presented and defended.

The defense is organized and scheduled by the Dissertation Committee. All Institute faculty members may observe and ask questions at all NYU-Poly dissertation defenses. Therefore, the date of the defense must be announced Institute-wide at least one month before the event, and copies of the draft dissertation must be available to any faculty member who requests one in a timely fashion and in no case less than two weeks before the defense.

Computer Science, Ph.D.

Requirements for PhD in Computer Science

Entrance Requirements

The preliminary requirements for admission to the program include the following:
1. A Bachelor’s degree in science, engineering or management from an accredited school and a superior academic record, or
2. A Master’s degree or one year of graduate work in an analytically based area and a superior academic record. Applicants must submit GRE general exam scores, at least two letters of recommendation, a statement of purpose and all relevant academic records, in addition to the completed application form.

The PhD program consists of four parts:

A. Courses
B. Qualifying exams
C. Dissertation Proposal
D. Dissertation

Core Electives and Credits Requirements

A minimum of 75 credits of graduate work is required beyond the BS degree, including at least 21 credits of dissertation. A Master of Science in Computer Science degree may be transferred in as 30 credits without taking individual courses into consideration. Other graduate course work may be transferred in on an individual-course basis. This transfer includes courses taken for degrees other than a Master of Science in Computer Science.

Students must take at least two courses in each of the following three areas. In the theory area, one of these two courses must be Theory of Computation (CS 6753), unless an equivalent course has been taken. In selecting these courses, students should not choose courses that overlap substantially with previous courses at NYU-Poly or elsewhere.

Systems Core Area

CS 6143 Computer Architecture II

3 Credits This course covers high-speed computer design. Topics: Uni-processor computer architectures that exploit parallelism, advanced pipelining, superscalar, VLIW, vector processors. Parallel processing: Interconnection structures, MIMD and SIMD systems. Other selected parallel computing topics, such as parallel algorithms, PRAM machines and multicore processing.

Prerequisite(s): Graduate status and CS 6133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6243 Operating Systems II

3 Credits This course surveys recent important commercial and research trends in operating systems. Topics may include virtualization, network server design and characterization, scheduling and resource optimization, file systems, memory management, advanced debugging techniques, data-center design and energy utilization.

Prerequisite(s): CS 6233.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6253 Distributed Operating Systems

3 Credits This course introduces distributed-networked computer systems. Topics: Distributed control and consensus. Notions of time in distributed systems. Client/Server communications protocols. Middleware. Distributed File Systems and Services. Fault
tolerance, replication and transparency. Peer-to-peer systems. Case studies of modern commercial systems and research efforts.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6843 Computer Networking

3 Credits This course takes a top-down approach to computer networking. After an overview of computer networks and the Internet, the course covers the application layer, transport layer, network layer and link layers. Topics at the application layer include client-server architectures, P2P architectures, DNS and HTTP and Web applications. Topics at the transport layer include multiplexing, connectionless transport and UDP, principles or reliable data transfer, connection-oriented transport and TCP and TCP congestion control. Topics at the network layer include forwarding, router architecture, the IP protocol and routing protocols including OSPF and BGP. Topics at the link layer include multiple access protocols, ALOHA, CSMA/CD, Ethernet, CSMA/CA, wireless 802.11 networks and link layer switches. The course includes simple quantitative delay and throughput modeling, socket programming and network application development and Ethereal labs.

Prerequisite(s): Graduate status and CS 2134.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6813 Information, Security and Privacy

3 Credits This course introduces Information Systems Security and covers cryptography, capability and access control mechanisms, authentication models, security models, operating systems security, malicious code, security policy formation and enforcement, vulnerability analysis, evaluating secure systems.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6823 Network Security

3 Credits This course begins by covering attacks and threats in computer networks, including network mapping, port scanning, sniffing, DoS, DDoS, reflection attacks, attacks on DNS and leveraging P2P deployments for attacks. The course continues with cryptography topics most relevant to secure networking protocols. Topics covered are block ciphers, stream ciphers, public key cryptography, RSA, Diffie Hellman, certification authorities, digital signatures and message integrity. After surveying basic cryptographic techniques, the course examines several secure networking protocols, including PGP, SSL, IPsec and wireless security protocols. The course examines operational security, including firewalls and intrusion-detection systems. Students read recent research papers on network security and participate in an important lab component that includes packet sniffing, network mapping, firewalls, SSL and IPsec.

Prerequisite(s): Graduate status and EL 5363 or CS 6843.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Theory Core Area
CS 6043 Design and Analysis of Algorithms II

3 Credits This course covers techniques in advanced design and analysis. Topics: Amortized analysis of algorithms. Advanced data structures: binomial heaps, Fibonacci heaps, data structures for disjoint sets, analysis of union by rank with path compression. Graph algorithms: elementary graph algorithms, maximum flow, matching algorithms. Randomized algorithms. Theory of NP-completeness and approach to finding (approximate) solutions to NP-complete problems. Selected additional topics that may vary.

Prerequisite(s): Graduate status and CS 6033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6753 Theory of Computation

3 Credits This course introduces the theory of computation. Topics: Formal languages and automata theory. Deterministic and non-deterministic finite automata, regular expressions, regular languages, context-free languages. Pumping theorems for regular and context-free languages. Turing machines, recognizable and decidable languages. Limits of computability: the Halting Problem, undecidable and unrecognizable languages, reductions to prove undecidability. Time complexity, P and NP, Cook-Levin theorem, NP completeness.

Prerequisite(s): Graduate status and CS 6003 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6903 Modern Cryptography

3 Credits This course examines modern cryptography from a theoretical perspective, with an emphasis on “provable security.” The course looks particularly at cryptographic primitives that are the building blocks of various cryptographic applications. The course studies notions of security for a given cryptographic primitive, its various constructions and respective security analysis based on the security notion. The cryptographic primitives covered include pseudorandom functions, symmetric encryption (block ciphers), hash functions and random oracles, message authentication code, asymmetric encryption and digital signatures. Time permitting, the course covers how to build secure cryptographic protocols for authenticated key exchange, using the primitives studied. Also covered: various number-theoretic assumptions upon which cryptography is based.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6703 Computational Geometry

3 Credits This course introduces data structures and algorithms for geometric data. Topics include intersection, polygon triangulation, linear programming, orthogonal range searching, point location, Voronoi diagrams, Delaunay triangulations, arrangements and duality, geometric data structures, convex hulls, binary space partitions, robot motion planning, quadtrees, visibility graphs, simplex range searching.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Programming/Software Core Area
CS 6063 Software Engineering I

3 Credits The course emphasizes the full software-engineering approach with alternative approaches. Technical emphasis is on requirements, design, development and modeling. Management issues include software cost estimating and project management. Understanding the processes applicable to the software development/integration cycle and maintenance along with technology changes on quality and development activities is highlighted.

Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6073 Software Engineering II

3 Credits The course covers modern, advanced software engineering approaches with theory and practice orientations. Important design and management issues are analyzed and evaluated. Technical and management tradeoffs in distributed software systems are emphasized. An extensive number of real world case studies are assessed. A class project is required.

Prerequisite(s): Graduate status and CS 6063.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6083 Principles of Database Systems

3 Credits This course broadly introduces database systems, including the relational data model, query languages, database design, index and file structures, query processing and optimization, concurrency and recovery, transaction management and database design. Students acquire hands-on experience in working with database systems and in building web-accessible database applications.

Prerequisite(s): Graduate status, CS 6003 or equivalent, familiarity with basic data structures and operating system principles.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6413 Compiler Design and Construction

3 Credits This course covers compiler organization. Topics: Lexical analysis, syntax analysis, abstract syntax trees, symbol table organization, code generation. Introduction to code optimization techniques.

Prerequisite(s): CS 5403, CS 6133 and CS 6033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6533 Interactive Computer Graphics

3 Credits This course introduces the fundamentals of computer graphics with hands-on graphics programming experiences. Topics include graphics software and hardware, 2D line segment-scan conversion, 2D and 3D transformations, viewing, clipping, polygon-scan conversion, hidden surface removal, illumination and shading, compositing, texture mapping, ray tracing, radiosity and scientific visualization.

Prerequisite(s): Graduate status and CS 5403 or equivalents and knowledge of C or C++ programming.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CS 6613 Artificial Intelligence I

3 Credits Artificial Intelligence (AI) is an important topic in computer science and offers many diversified applications. It addresses one of the ultimate puzzles humans are trying to solve: How is it possible for a slow, tiny brain, whether biological or electronic, to perceive, understand, predict and manipulate a world far larger and more complicated than itself? And how do people create a machine (or computer) with those properties? To that end, AI researchers try to understand how seeing, learning, remembering and reasoning can, or should, be done. This course introduces students to the many AI concepts and techniques.

Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 9163 Application Security

3 Credits This course addresses the design and implementation of secure applications. Concentration is on writing software programs that make it difficult for intruders to exploit security holes. The course emphasizes writing secure distributed programs in Java. The security ramifications of class, field and method visibility are emphasized.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

The CSE faculty may modify these area course offerings from time to time. Certain selected topics courses may be used to fulfill these requirements, with prior written permission from the CSE Department.

Students must receive at least a grade of B in each of the six courses; further, the grade point average over these six courses must be at least a 3.5. Full-time students must complete these course requirements by the end of their second year.

Additionally, for each of the courses Computer Architecture I (CS 6133), Operating Systems I (CS 6233), Design and Analysis of Algorithms I (CS 6033), Programming Languages (CS 6373), the following rule applies: The student must take the course unless it was taken as an equivalent course (at either the graduate or undergraduate level) with a grade of B or higher; if the student took an equivalent course and received a B grade or higher, he or she is not be permitted to take the course at the Institute as part of this PhD program without special permission.

Qualifying Exam

The qualifying exam assesses the student’s knowledge of computer science and ability to perform dissertation-level research. The student’s evaluation is based on two components: a research exam and course work.

Research Exam

After entering the PhD program, each student works on a research project directed by a research adviser. By the end of the second year, the student must take a research exam based on this work. The research exam is tailored to the student’s research and has the following three parts:

1. Written report
2. Oral presentation
3. Answering of questions posed by the research exam committee

The written report must be submitted to the research-exam committee at least one week before the oral presentation. The oral presentation is open to the public. Following the presentation, the student answers questions posed by the research-exam committee.

The research exam assesses the student’s ability to do dissertation-level research. The exact format of the report and presentation may vary depending upon the student’s focus area and previous research accomplishments. The student must have the format approved by his/her research adviser. If students have their research results by the time of the research exam, then they should focus their report and presentation on those results and discuss related work and ideas for future research. If students have not yet obtained research results or have only preliminary results, their report and presentation should consist of a survey of related work, a discussion of ideas pursued so far, and ideas for future research.

Students may schedule research exams during two time periods in the year; a range of dates near the end of the Fall and Spring semesters will be announced in advance by the graduate director. To take the research exam, a student, in consultation with his/her research adviser, must form (at least one month before the exam) a research exam committee comprising three faculty members—one is the research adviser and, at most, two are from outside the department or from outside the Institute.

**Course Component**

The student’s overall course performance is evaluated as part of the qualifying exam. Special emphasis is placed on performance in PhD core courses. Students taking the research exam in their third semester must complete at least four PhD core courses by the end of the third semester for their course performance to be evaluated at the end of the third semester. Otherwise, their evaluation is delayed until the end of the fourth semester, by which time they must have taken all six PhD core courses.

Evaluation of the student’s course performance usually is based on a review of the student’s transcript and possible consultation with course instructors. However, in special cases, students may be subject to additional evaluation and/or additional written exams in some core course areas.

**Evaluation of Performance on the Qualifying Exam**

The overall decision on whether a student passes or fails the qualifying exam is determined at a meeting of the CSE faculty, which examines the research-exam result and evaluates the student’s course performance. The faculty may issue a grade of pass, fail or conditional pass. The faculty may use the grade of conditional pass to impose additional specific and time-restricted requirements on the student. Such a grade is converted to a pass or a fail, depending on whether the student meets these requirements.

Students who do fail the qualifying exam on the first attempt may retake it once. The second attempt must be made by the end of the student’s fifth semester. Students who do not pass the qualifying exam on their second attempt are dismissed from the PhD program.

**Note:**

A student may take thesis credits only after passing the qualifying exam. Students entering the PhD program with a master’s degree in CS are urged to take the research exam and at least four of the required PhD core courses by the end of the third semester. In this way, the student has the potential to pass the qualifying exam by the end of the third semester and to begin taking thesis credits in the fourth semester.

**Dissertation**

The last, and most substantial, aspect of the PhD program is the dissertation. The dissertation must embody a significant original research contribution and must be written in accepted scholarly style. The research should be conducted in close consultation
with the student’s adviser. It is strongly recommended that at least one paper on the research be submitted to a refereed archival journal or refereed conference. When the adviser feels that the student has obtained sufficiently significant research results and has written an acceptable dissertation, a public dissertation defense is scheduled. The defense includes the candidate’s oral presentation and questions from the dissertation committee.

Additional requirements for the PhD dissertation are available from the office of the Associate Provost of Research and PhD Programs.

**Electrical Engineering, Ph.D.**

**Requirements for the Doctor of Philosophy**

**General:** Graduate students who exhibit high scholastic proficiency and demonstrate an ability to conduct independent research may extend their goals toward the doctorate. The PhD is awarded to students who complete the studies and research program (described below) and prepare and defend a dissertation. The dissertation must represent an original, significant contribution, qualified for publication in a recognized scientific or engineering journal.

**Admission to Programs:** Entrance into the doctoral study and research program is contingent on a candidate’s passing the departmental qualifying examination and forming a guidance committee (both described below). Students entering the doctoral program at the baccalaureate level must meet the entrance requirement detailed above for the master’s program. Students entering at the master’s level for the PhD in Electrical Engineering are expected to have a master’s in electrical engineering. Students holding a NYU-Poly master’s degree in computer or systems engineering, electrophysics or telecommunications networks also can enter the program. Applicants with BS or MS in other disciplines may be admitted depending on academic background and record.

**Qualifying Examinations:** PhD qualifying examinations are offered twice a year. These examinations are divided into two sections: (1) a written examination requiring preparation through first-year graduate level courses in several areas related to the student’s principal interest and (2) an oral examination concentrating mainly on this principal area. Principal concentration areas are communications, signal processing, systems and control, electromagnetics, networks, computer and network architecture, and power electronics and systems.

Details on allowed subject areas, recommended background courses, sample examination questions and the precise format for the coming year are available in the department’s Graduate Office.

**Guidance Committee:** Upon passing the qualifying examination, PhD students must find a faculty member in their major interest area to serve as dissertation adviser. Students work with their dissertation advisers to find an adviser for a minor area outside of electrical engineering and a guidance committee of at least three faculty members. The dissertation adviser usually acts as chairman. At least one other guidance committee member must be in the student’s major research interest area; this member may be from outside of NYU-Poly.

The minor adviser may be a member of the guidance committee. Students must submit names of these guidance committee members to the Office of Graduate Programs for approval. The dissertation adviser approves the study program in the student’s major and the minor adviser approves the program of courses in the minor.

When the requirements for minor or major are completed, students should have the relevant adviser certify the completion in writing to the Office of Graduate Affairs, with copies to the Department of Electrical and Computer Engineering’s Graduate Office.

The guidance committee conducts the area examination and dissertation defense and approves the final dissertation.

**Course and Thesis Requirements:** A minimum of 75 credits of academic work beyond the bachelor’s degree, including a minimum of 21 credits of NYU-Poly dissertation research, is required. A minimum of 42 credits in formal courses (as distinct
from independent study credits such as reading, project or thesis) are required. A student entering with a MS from a reputable graduate program may transfer 30 credits. PhD students are required to take a minimum of 9 credits of courses in a minor area outside of electrical engineering. The minor must be taken in an area that is both distinct from and yet consonant with the student’s major study area. Students work with thesis advisers to develop their major study program. The major program should constitute a coherent, in-depth study of the most advanced knowledge in the student’s area of concentration.

Average GPA among all courses must be 3.5 or above.

**Seminar Attendance:** PhD students are required to register for a 0-credit Research Seminars course (EL9900) for at least 4 semesters. Satisfactory grade is given only if the student attends more than 2/3 of the seminars offered in a semester.

**Area Examination:** In the area examination, the student reviews the prior research in the chosen dissertation topic and presents preliminary research results and additional research plan. The guidance committee evaluates the student’s performance and determines whether the student demonstrates the depth of knowledge and understanding necessary to carry out research in the chosen area. The examination should be taken early in the PhD program and may be in the form of an open seminar attended by other interested faculty and students.

**Submission of the Dissertation and Final Examination:** After completing the doctoral dissertation, candidates undergo oral-thesis defense. The guidance committee conducts the examination, but the defense is open to all faculty members and to invited persons. Dissertation copies should be made available to prospective examiners at a reasonable advance time. Students are advised to consult the Office of Research and PhD Programs regarding how to submit, reproduce and bind the final manuscript.

**Publication Requirement:** To be granted the PhD degree, a PhD candidate must have at least one accepted or submitted journal paper on the thesis-research subject.

---

**Materials Chemistry, Ph.D.**

Requirements for the Doctor of Philosophy

Candidates for the degree Doctor of Philosophy in Materials Chemistry are to plan their programs in accordance with the requirements listed below.

A. Required (core) courses, 4 courses 3 credits each:

1. Physical chemistry

**CM 7043 Statistical Thermodynamics and Kinetics**

*3 Credits* This course covers statistical mechanics for chemical systems. Also covered are ensembles, partition functions, thermodynamic functions, applications to various systems, including non-ideal gas, gas of diatomic molecules, polymer, surface phenomena, chemical equilibria, biophysics and reaction kinetics.

*Prerequisite(s): Undergraduate physical chemistry and physics or adviser’s approval.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
2. Organic chemistry

**CM 9033 Physical Organic Chemistry**

*3 Credits* This course covers molecular structure and bonding. Also covered are stereochemical and conformational principles; theories of bonding; physical parameters of stable and reactive molecular states; and applications in biochemistry and polymer chemistry.

*Prerequisite(s):* Undergraduate organic chemistry or adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

3. Analytical chemistry

(one of the following two)

**CM 8023 Principles of Spectroscopy**

*3 Credits* This course covers rotational, vibrational and electronic states of atoms and molecules. Also covered are the interaction of radiation with atoms and molecules; molecular symmetry; rotational and vibrational spectroscopy; and electronic spectroscopy.

*Prerequisite(s):* Undergraduate physical chemistry or adviser approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 8073 Organic Spectroscopy**

*3 Credits* This course covers structure elucidation by joint applications of spectroscopic techniques such as proton and carbon-13 magnetic resonance, infrared and mass spectroscopy and other methods.

*Prerequisite(s):* CM 9033 or Adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

4. Inorganic chemistry, polymer chemistry, or biochemistry

(one of the following three courses)

**CM 6013 Advanced Inorganic Chemistry**

*3 Credits* This course covers theories of bonding in inorganic compounds. It introduces group theory as applied to molecular orbital and ligand field theories. Also covered are spectra of inorganic compounds and non-aqueous solvent. The transition to metal chemistry is introduced.

*Prerequisite(s):* Adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 9413 Biochemistry I

3 Credits This course covers structure and function of biological macromolecules: proteins, nucleic acids, polysaccharides. Also covered are enzymatic kinetics, mechanism and control.

Prerequisite(s): Undergraduate biochemistry or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7723 Synthesis of Macromolecules

3 Credits This course covers organic aspects, including chemistry of monomer and polymer formation; modern mechanistic analyses of reactions; stereochemistry of polymer structures; forces of stereo regulation; condensation, free radical (bulk, suspension, emulsion, solution), ionic, ring-opening and non-classical polymerization reactions.

Prerequisite(s): Undergraduate organic chemistry or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

B. Electives: 12 Credits

two courses from CM listing and two courses from CM, BE, BT and CBE listings

C. Seminar, 3 semesters: 4.5 Credits

CM 9731 Seminar in Chemistry I

1.5 Credits This course covers chemical topics of current interest and is presented by participating students, staff and outside speakers.

Note: One semester is required for MS chemistry students; three semesters required for PhD candidates.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9741 Seminar in Chemistry II

1.5 Credits This course covers chemical topics of current interest and is presented by participating students, staff and outside speakers.

Note: One semester is required for MS chemistry students; three semesters required for PhD candidates.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9751 Seminar in Chemistry III
1.5 Credits This course covers chemical topics of current interest and is presented by participating students, staff and outside speakers.

Note: One semester is required for MS chemistry students; three semesters required for PhD candidates.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

D. Chemical Literature: 1.5 Credits

CM 5021 Information Sources for the Chemical Sciences

1.5 Credits This course is a hands-on introduction to methods and tools for searching and includes both electronic (CD-ROM and online) as well as print databases. Students may emphasize topics related to their research. Graduate students are required to take this course.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

E. Chemical Colloquium: 0 Credits

- CM 9710 Chemical Colloquium

F. Chemical Laboratory Safety: 0 Credits

CM 5040 Chemical Laboratory Safety

0 Credits This course discusses problems of health and safety in chemical laboratories, including how to work safely with dangerous chemicals. This course must be completed by graduate and undergraduate chemistry students before they begin laboratory research.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

G. Thesis Research: 36 Credits (minimum)

CM 999X PhD Dissertation in Materials Chemistry

36 credits minimum Credits This course requires original experimental or theoretical research, guided by a chemistry faculty member, that may serve as basis for a PhD. The minimum research registration requirement is 36 credits. Registration is required each semester consecutively until students complete adequate research projects and acceptable theses and have passed required oral examinations. A research fee is required.

Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam
H. The rest, if any, are electives

(from CM, BE, BT, and CBE listings) up to 9 credits.

Total: 75 Credits

Students must pass a comprehensive qualifying examination in chemistry and present a doctoral dissertation. The qualifying exam is given once a year. Additional details on the qualifying examination should be obtained from the graduate adviser. Each candidate for the doctorate must complete a minimum of 75 credits of academic work past the bachelor’s degree, including a minimum of 36 credits of dissertation research. Of those 75 credits required, at least 45 credits must be taken at NYU-Poly. Of the total 36 to 45 credits for dissertation research, up 12 credits can be transferred from research credits taken at another institution before coming to NYU-Poly. If the courses transferred from another institution do not include all four core courses, the missing core courses must be taken at NYU-Poly. The remaining courses to satisfy the doctoral degree are selected in consultation with the student’s adviser.

Candidates must have an overall B average in the core courses as well as in the core and elective courses (excluding seminar, chemical literature and thesis).

The student is required to declare a concentration by taking three courses from one of the following five areas: physical chemistry, organic chemistry, analytical chemistry, biochemistry and polymer chemistry. One of the three courses can be a core course. The course description indicates which courses qualify for the five areas. The GPA of the three courses must be B or better. Students must be in continuous attendance at the departmental colloquia (CM 9710).

Mathematics, Ph.D.

Requirements for the Doctor of Philosophy

Requirements for the doctoral degree are primarily qualitative rather than quantitative. All students’ programs require the approval of the guidance committee.

The number of graduate credits usually associated with the PhD in mathematics is 60 credits (course = 3 credits). The courses are to be selected from a well-balanced program in one major and two minor fields. The minor fields are encouraged to be chosen outside the Department of Mathematics, selected from such fields as applied mechanics, financial engineering, control theory, computer science, traffic engineering and electrical engineering. 39 credits of course work and at least 21 credits of thesis are required.

Required (core) courses, 12 credits, 3 credits each:

MA 7033 Linear Algebra I

3 Credits This course covers: Basic ideas of linear algebra: Fields, vector spaces, basis, dependence, independence, dimension. Relation to solving systems of linear equations and matrices. Homomorphisms, duality, inner products, adjoints and similarity.

Prerequisite(s): MA 2012 and MA 2122 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 7043 Linear Algebra II

3 Credits This course continues MA 7033. Topics covered: Basic concepts of linear algebra continuing with: Range, nullity, determinants and eigenvalues of matrices and linear homomorphisms, the polar decomposition and spectral properties of linear maps, orthogonality, adjointness and its applications.

Prerequisite(s): MA 7033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6213 Elements of Real Analysis I

3 Credits This course and its sequel MA 6223 rigorously treat the basic concepts and results in real analysis. Course topics include limits of sequences, topological concepts of sets for real numbers, properties of continuous functions and differentiable functions. Important concepts and theorems include supremum and infimum, Bolzano-Weierstrass theorem, Cauchy sequences, open sets, closed sets, compact sets, topological characterization of continuity, intermediate value theorem, uniform continuity, mean value theorems and inverse function theorem.

Prerequisite(s): MA 2122 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6223 Elements of Real Analysis II

3 Credits This course continues MA 6213. The topics are integration, series of real numbers, sequences and series of functions and Fourier series. Important concepts and theorems include Riemann and Riemann-Stieltjes integral, fundamental theorem of calculus, the mean value theorem of integrals, Dirichlet test, absolute and conditional convergence, uniform convergence, Weierstrass test, power series, orthogonal functions and Fourier series.

Prerequisite(s): MA 6213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Note:

A grade of A is necessary in these required courses for PhD credit (they may be repeated).

Only courses with grades of B or better can be used to satisfy the PhD requirements.

Students are required to pass a Part 0 written examination covering fundamental topics; a Part 1 written examination covering real and complex analysis and linear and abstract algebra and a Part 2 oral examination on topics chosen by the student and thesis adviser.

After passing the Part 2 examination, the student writes a dissertation under the supervision of a faculty adviser.

The final requirement for the PhD degree is a public oral exam on the student’s dissertation.

Students must demonstrate the ability to read mathematical text written in French, German, or Russian.

Mechanical Engineering, Ph.D.
Requirements for the Doctor of Philosophy

The PhD is a terminal degree beyond the MS and focuses on engineering research. Students are expected to advance the state of the art in their specialty by original and creative work. A MS in Mechanical or Aerospace Engineering or other closely related engineering or applied sciences fields is required for admission to the PhD degree program. A 3.5 GPA or better in the MS work is generally required for admission. In cases where it is unclear that the required MS specialization has been satisfied, the MS degree requirements of the preceding section will define the necessary reparation. The same criterion is used when the MS degree is in other engineering disciplines. Students with a BS degree in Mechanical or Aerospace Engineering and a GPA of 3.5 or better may apply directly for admission to the PhD program. Students have to take a written and oral departmental qualifying examination within the first two offerings of the exam after the date they join the doctoral program.

The general credit requirements for the PhD degree (beyond the BS degree and including MS degree credits) are:

<table>
<thead>
<tr>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer from MS degree</td>
</tr>
<tr>
<td>Approved course work beyond the MS degree</td>
</tr>
<tr>
<td>PhD Dissertation (ME 999X)</td>
</tr>
</tbody>
</table>

Minimum total required 75 (minimum)

Studies for the PhD degree must be completed in five years after the MS degree or the date of admission, whichever is later, unless a formal leave of absence is approved before the period for which the studies are interrupted.

Once the dissertation is begun (after the student passes the PhD Qualifying Exam and forms a PhD Guidance Committee), the student must register for at least 3 credits of ME 999X PhD Dissertation in Mechanical Engineering each fall and spring semester. Actual registration should reflect the pace of the work and the activity of the student. An exception to the minimum registration requirement may be made in the last semester of registration if that semester is devoted primarily to complete the work and dissertation. A dissertation grade of U for two consecutive terms affects whether a student will be permitted to continue doctoral work. Students are required to present the progress in their dissertation work to their guidance committees at least once a year.

Details on the PhD degree requirements and additional requirements can be found in the departmental pamphlet on the topic.

General Credit Requirements

The general credit requirements for the PhD degree (beyond the BS degree and including MS degree credits) are:

75 Credits
(minimum)

Studies for the PhD degree must be completed in five years after the MS degree or the date of admission, whichever is later, unless a formal leave of absence is approved before the period for which the studies are interrupted.

Once the dissertation is begun (after the student passes the PhD Qualifying Exam and forms a PhD Guidance Committee), the student must register for at least 3 credits of ME 999X PhD Dissertation in Mechanical Engineering each fall and spring semester. Actual registration should reflect the pace of the work and the activity of the student. An exception to the minimum registration requirement may be made in the last semester of registration if that semester is devoted primarily to complete the work and dissertation. A dissertation grade of U for two consecutive terms affects whether a student will be permitted to continue doctoral work. Students are required to present the progress in their dissertation work to their guidance committees at least once a year.

Details on the PhD degree requirements and additional requirements can be found in the departmental pamphlet on the topic.

Technology Management, Ph.D.

Degree Requirements and Curriculum

The curriculum for the PhD-TM Program fosters a research-intensive doctoral education relevant for the rapidly emerging area of technology management. Management core courses provide a necessary foundation in management. Technology management courses expose students to the fundamental and most current research and thinking in the broadly defined technology management field. Research methods courses help students develop quantitative and qualitative research skills. Thematic elective courses help students gain in-depth knowledge in a focused thematic area related to technology management. Working together, students and doctoral advisers select which courses relate to the student’s course of study in the PhD-TM Program. As part of each thematic elective course, students also take an associated thematic independent research course to investigate thoroughly previous research in the selected theme. All PhD students must undertake a doctoral research project, preferably in the second summer semester of study. This course introduces students to the requirements of management research. Finally, students work on the dissertation, an original investigation of a research question(s) related to technology management. Students are required to complete 75 credits, including 51 credits from the course work and 24 credits from the dissertation. For the most current information visit: http://www.poly.edu/academics/programs/technology-management-phd.

1. Management Core Courses: 15 Credits

Management core courses should be taken as early in the program as possible. Choose five courses.

**MG 6013 Organizational Behavior**

3 Credits Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

*Note: Distance learning available.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6073 Marketing

3 Credits This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6083 Economics

3 Credits The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6093 Accounting and Finance

3 Credits The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6303 Operations Management

3 Credits This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6503 Management of Information Technology and Information Systems

3 Credits This course is for managers who need to understand the role and potential contribution of information technologies in organizations. The course focuses on different information technologies and their applications in managing business-critical data, information and knowledge. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process re-engineering, knowledge management and group support systems.
2. Technology Management Courses: 9 Credits

Choose three courses

**MG 6313 Organization Theory and Design**

*3 Credits* Introduction to theories of organizations including structure, design and culture. Provides an understanding of how organizations work and their interrelationship with the external environment. Examines the process by which managers select and manage aspects of structure and culture to achieve organizational goals. Topics include characteristics of bureaucracy, adhocracy, sub-optimization, human dynamics and informal systems; influence and control systems; management of technology; and planned change. Examination of organizations through research and case studies.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6543 Economics for Information Sectors**

*3 Credits* This course in applied competitive strategy draws upon recent experiences associated with the impact of information technology upon diverse industries. Students master a basic understanding of the economic and competitive implications of information technology. Students gain competence in analysis by understanding how the availability of information (through technology or otherwise) affects the basic strategic options available, and how firms and industries are likely to be affected. Students are introduced to the often poorly-structured process of evaluating the economics of potential systems innovations. Students then can participate in strategic-systems planning from a managerial point of view.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6603 Management of New and Emerging Technologies**

*3 Credits* This course surveys and explores the business implications of selected new and emerging technologies with the potential to change business practices and create new industries. Technologies discussed include new Internet architectures, Wikis, Open Source, security issues, new Web services, social networking and Web 2.0. This course is for the manager who is interested in staying current with, and learning about, new technologies for use in business. No specific engineering background is required. A variety of reference texts, journals, case studies and websites is used.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8653 Managing Technological Change and Innovation**

*3 Credits* This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.
Also listed under: MN 8653.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8693 Special Topics**

3 Credits This course requires Individualized readings on special topics assigned by instructor.

Prerequisite(s): Doctoral standing or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**Associated Doctoral Seminars: 12 Credits**

Four 3-credit doctoral seminar courses must be taken with an associated technology management course. These seminars provide strong research background required for doctoral studies in technology management.

Choose four seminars.

**MG 9203 Seminar in Managing Knowledge-Workers in Innovative Organizations**

3 Credits Knowledge workers, who are primarily in professional and technical occupations, now represent the most important segment of the U.S. labor force. The success of innovative organizations today results largely from the knowledge and skills applied by their professional and technical employees. The effective management of such a work force is one of the most critical problems faced by innovative organizations in the private and public sectors. This seminar closely examines theory and research and various management techniques to improve the use and development of knowledge workers in innovative organizations.

Prerequisite(s): Doctoral standing or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9213 Seminar in Information Systems Management**

3 Credits This course provides PhD-TM students and those in other related fields with a perspective on modern information-systems methodologies, technologies and practices. State-of-the-art research on frameworks for analysis, design and implementation of various types of information systems is presented. Also covered are economic and strategic issues related to information technology; the emphasis is on research in organizational, inter-organizational and strategic settings. The course follows a seminar format, and students are assigned paper-based and Web-based readings. Student’s contributions are expected during class sessions, both as participant and, for one class, as moderator.

Prerequisite(s): Doctoral standing or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9223 Seminar in Business Process Innovation**

3 Credits This doctoral seminar explores dimensions and issues pertaining to the technology-business process interface that are critical to superior performance in today’s modern networked corporations. Students discuss how technology has affected everything from common business tasks to complex and global supply-chain integration. Qualitative and quantitative aspects in these areas are addressed. The class also discusses articles on leading-edge research and management thought. The underlying objective is to expose the student to the rich and emergent literature in modern supply-chain management, technology integration
and business model evolution. Major seminar themes include technology integration, product and process innovation, marketing, logistics, operations, IT and channel management issues in supply chains across various industries. The seminar emphasizes understanding the role of technology in the supply chain and its relation to business processes and innovation.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9233 Seminar in Managing Technological Change and Innovation**

*3 Credits* The objectives of this seminar are to familiarize students with the key viewpoints in the literature on technological innovation. Readings are selected to highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this body of literature set the stage for future research work in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9243 Technology Management and Policy**

*3 Credits* This course focuses on the research related to macro-environment that influences and that is relevant to technology decision making, strategy and innovation in firms, government agencies, nonprofit institutions and other organizations. Primary concerns include introducing effective approaches for analyzing and evaluating societal-wide factors that influence innovation; assessing various attempts and policies for stimulating innovation in a city, region, nation or globally; exploring the role of technology and innovation in diverse managerial, economic and social contexts (e.g., advanced economies, rapidly emerging economies and Third World economies); the relationship between business-government and NGOs (non-government organizations) in promoting and sustaining innovation; the impact of global rivalry and global cooperation in the technology and innovation arena; and the place of technology and innovation in the post–Cold War era and in the early 21st century.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9253 Technology Strategy, Structure and Decision Making**

*3 Credits* This course explores the most important and relevant theories and concepts related to technology strategy, structure and decision making. The emphasis is on understanding the useful application of such ideas for modern technology management and for designing effective scholarly research that deals with the strategic, structural and decision-making aspects of innovation and technology management.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9263 Strategic Marketing Seminar**

*3 Credits* This course examines strategic marketing issues that face firms and industries from theoretical and empirical perspectives. The seminar looks at product design, positioning and strategy, distribution, sales force, design of the marketing organization, competition, market structure, problems of information, signaling and pricing, corporate reputation and branding, advertising and promotion, and recent advances in product and service development.
**MG 9273 Doctoral Seminar in Technology Adoption and Diffusion**

*3 Credits* This seminar familiarizes students with the key viewpoints in the literature of technology adoption and diffusion. Readings are selected to highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this literature sets the stage for future research in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9283 Doctoral Seminar on Entrepreneurship**

*3 Credits* This seminar familiarizes students with key viewpoints in the literature on entrepreneurship. Readings highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this literature sets the stage for future research in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9293 Seminar on Content Innovation**

*3 Credits* Because the Internet has evolved to provide a robust technology platform on which to create content, the notion of what comprises content has expanded to include not only one-dimensional content, (print newspapers, books and music recordings, the core output of traditional media companies) but also multidimensional, nonlinear content that can reside in physical, digital or hybrid (physical and digital) spaces. The popularization and proliferation of this new content has affected profoundly the development of the creative industries (e.g., publishing, newspapers, video games, fashion and music) and thus significantly challenges managers. This seminar explores the evolution of content innovation and focuses on several major issues, including the restructuring of creative industries and related managerial challenges resulting from developments in content innovation; the impact of restructuring creative industries on the development of urban centers of creativity and technoculture, such as Silicon Alley in New York City and Hollywood, California; the role of technology companies, particularly hybrid telecommunications/content companies and how they intersect with the creative industries and influence content innovation; the media and its symbiotic relationship with politics.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9303 Advanced Topics—Organizational Behavior and Organizational Theory**

*3 Credits* This course familiarizes students with a broad range of theoretical perspectives in contemporary organization theory and organizational behavior. The course spans levels of analysis. It adopts mostly a practice perspective and focuses on meso-levels of analysis (inter-group collaboration and competition) and micro-levels of interpersonal and social psychological processes within organizations.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 9313 Introduction to Behavioral Sciences

3 Credits This interdisciplinary seminar is limited to doctoral students. The seminar focuses on behavioral sciences, the areas of inquiry relating to the human condition or human behavior. This definition encompasses a wide variety of disciplines, from the social sciences and humanities to a corner of the biological sciences. The fields of study are as diverse as comparative literature, geography, psychiatry and mathematics (to name just a few). The course focuses on sociology, anthropology, history and political science; the emphasis is on sociology. The course explores a number of topics (social order, social solidarity, conflict, social classes, status) that have generated strong interest among social scientists. The course and the final paper pay special attention to the process of developing original theoretical arguments, suitable for empirical exploration.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9323 Special Topics

3 Credits

Note:

Doctoral seminars are offered on a rotating basis. Not all the course options are available to all PhD-TM students during their study.

3. Research Methods Courses: 12 Credits

Students must take all four courses.

MG 9403 Business Research Methods

3 Credits This course introduces theory and techniques of business research methods. The course introduces the philosophy of science and the principles of investigation in the social sciences. Students learn to design a study, sample and choose a research design. Also discussed are basic data preparation, measurement and analysis procedures, focusing on univariate and multivariate statistics.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9413 Quantitative Methods Seminar I

3 Credits The introductory PhD-level course covers quantitative analysis. Topics include specification, estimation and inference in the context of models that start with the standard linear regression framework. After reviewing the classical linear model, students develop the asymptotic distribution theory necessary for analyzing generalized linear and nonlinear models. Students then analyze estimation methods such as instrumental variables, maximum likelihood, generalized method of moments (GMM) and others. Inference techniques used in the linear regression framework (such as t and F tests) is extended to Wald, Lagrange multiplier, likelihood ratio and other tests. Finally, the linear regression framework is extended to models for panel data, multiple equation models and models for discrete choice.
**MG 9233 Seminar in Managing Technological Change and Innovation**

*3 Credits* The objectives of this seminar are to familiarize students with the key viewpoints in the literature on technological innovation. Readings are selected to highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this body of literature set the stage for future research work in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9433 Qualitative Research Methods**

*3 Credits* The course covers methods that allow students to enter natural social settings to capture data about human behavior in the actual contexts in which people pursue their daily lives. These methods include observation and interviewing. The emphasis is on studying close-up the worlds of other people. The course helps participants learn to make sense of data inductively, i.e., from the bottom up. This course is not about hypothesis testing. Rather, it is about building grounded theory. The focus is on coding and categorizing qualitative data (observational notes and interview transcripts). Students learn to go beyond journalistic description of data and use the analysis that characterizes good inductive social science.

Prerequisite(s): Doctoral standing or instructor’s permission.
Note: Independent Research
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

4. **Independent Research Project: 3 Credits**

**MG 9913 Independent Research**

*3 Credits* In this course, students undertake directed individual study or supervised readings in advanced areas of the thematic electives and are advised by the doctoral adviser. Three credits required.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

5. **Comprehensive Examinations**

Each student must successfully pass two comprehensive examinations before starting the dissertation.

Part One: This examination includes material covered in the master’s-level management core and technology management courses. It can be taken after completing 30 graduate credits.

Part Two: This examination includes material from the thematic elective and associated thematic research courses, doctoral seminars and research methods courses. It can be taken after completing required course work.
Students can take both examinations together. Results are provided within one month of the examination. Students have only two chances to pass each examination.

6. Doctoral Dissertation: 24 credits

The dissertation is evaluated in two parts: Proposal Defense and Final Defense. For details, contact the PhD-TM Program academic director.

** MG 999X PhD Dissertation in Technology Management **

3 Credits Students are required to complete 24 credits of doctoral dissertation research.

*Prerequisite(s):* Doctoral standing or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

7. Research training and interaction with faculty

Every student participates in formal and informal research seminars each week with departmental faculty and visitors. All members of the program are expected to participate in formal and informal seminars each week with departmental faculty and visitors. Each student is required to present research in progress once a year and works towards publishable papers, usually with a faculty as co-author. The seminar is a key component of the student training. Participation in other research seminars and activities at the department is also required.

Students are expected to work actively with one or more faculty each year. They learn to be researchers by doing research.

8. Advising and evaluating

The TM doctoral program faculty director advises all first-year doctoral students. During their first year students have many opportunities to get to know the research interests of all departmental faculty. By the beginning of the second year, students have selected an intermediary adviser who will guide them through the comprehensive exam process and up to the thesis stage. By the middle of the third year students will have selected a thesis adviser. Each year every student submits a statement of intellectual progress to his/her adviser. All faculty meet to review the progress of all students in a day-long meeting each year. At this time, the student's intellectual progress is reviewed and plans for the following year are considered. The results of this review include a formal letter to the student assessing the previous year's work and offering guidance for the following year's work.

9. Prerequisites

All PhD-TM students need a fundamental knowledge of probability and statistics. Students without such a background must take MG 5050 Probability and Managerial Statistics. Students without any background in professional writing and communications must take JW 6003 Introduction to Technical Communication or JW 6313 Proposal Writing. Students who have a master’s degree or who are transferring from other institutions (or other departments within Polytechnic) are admitted based on the same qualification standards that apply to new students. For each required MS- or PhD-level course, if students have taken a similar course, they may transfer credits for the course. However, students still have to take and pass both qualifying exams. A minimum of 30 credits, including all dissertation credit, must be taken at Polytechnic. No dissertation credits from other institutions can be transferred.

All students must take the required coursework as assigned and follow the stipulated curriculum. The course work must be finished within the first three years and the dissertation thesis within the next three years. Thus, all students (full-time and part-time) must complete all work for the doctorate within six years of initiation.
Total Credits for PhD-TM Program: 75

**Transportation Planning and Engineering, Ph.D.**

**Doctor of Philosophy in Transportation Planning and Engineering**

The PhD in Transportation is a research-oriented degree intended for those whose goal is a career in basic transportation research and/or teaching at the Institute level or in private research organizations.

**Goals and Objectives**

The fundamental goal of the PhD in Transportation Planning and Engineering is to develop professionals with strong research skills capable of advancing the profession of transportation planning and engineering through their work. Specific objectives of the program are to provide the skills necessary to:

- develop a strong and deep fundamental knowledge about the profession of transportation planning and engineering;
- develop the knowledge and skills to perform independent fundamental research in transportation planning and engineering;
- produce fundamental research that meaningfully advances the state-of-the-art of the profession of transportation planning and engineering.

**Program Requirements**

Students pursuing the PhD in Transportation Planning and Engineering generally specialize in one of the following subject areas:

- Transportation planning
- Traffic engineering
- Intelligent transportation systems
- Transportation safety

Other focus areas are possible and can be developed with the help of faculty advisers. All subject areas, of course, must be relevant to the degree sought and have a faculty member willing and able to guide the student’s research.

**Program Administration**

All graduate applications are processed through the civil engineering departmental office, which distributes applications to the graduate coordinator. Graduate program coordinators formally implement admission decisions, in accordance with departmental regulations. Coordinators consult with other department faculty as needed. They are also responsible for keeping records for all graduate students in their program areas, and for processing graduation audits for students in their program areas.

The graduate coordinators form the departmental Graduate Committee. All PhD applications are reviewed by the committee, and admissions decisions are made by the committee and implemented by the graduate coordinator.
For each registration, the student’s program must be approved by the academic adviser and signed by the transportation program coordinator.

**Admission Criteria to PhD Program**

Admission to the PhD in Transportation Planning and Engineering requires an MS in Transportation Planning and Engineering or equivalent, with a GPA of 3.5 or better (on a 0-4 scale).

Admission to PhD program does not require GREs (Graduate Record Examination), but applicants are encouraged to take these examinations. If these examinations are taken, the student must submit the results for consideration.

Foreign applicants must take the TOEFL examination and submit the results for consideration.

The “equivalent” of the MS degree can be achieved in several ways. The candidate may have an MS degree with a different title that covers substantially the same material. More generally, applicants must demonstrate that they have the equivalent of all undergraduate and master’s level course work in order to pursue doctoral level work in the major area. Further, “equivalence” is evaluated based on the totality of the student’s undergraduate and graduate record, not course-by-course.

Because admission to a PhD program requires a related MS (or equivalent), those applicants who have not yet achieved a master’s degree would normally be admitted as MS students. They are expected to earn an MS degree while completing their major and minor course requirements. In rare cases, an applicant with only a BS degree may be directly admitted into the PhD program with the written approval of the department head.

**Doctoral Committees**

Upon admission, every PhD student is assigned an academic adviser, who is selected by the department head. Any member of the civil engineering faculty can be an academic adviser to a graduate student. In cases where a student is supported on a research contract, the principal investigator of the contract would normally be appointed as the academic adviser for the student. Where a student has a particular research interest and is working with a particular faculty member, the student may request that the faculty member be appointed as academic adviser. In rare cases where a PhD student enters the program without a prior selection of a major area of study, the initial academic adviser will be the Graduate Coordinator of the transportation program.

In fulfilling their academic requirements, PhD candidates will deal with two advisory committees:

**Academic Advisory Committee**: The student’s academic adviser works out a program of courses to fulfill major and minor requirements for the PhD. The Academic Advisory Committee generally will comprise the academic adviser and one faculty member for each minor area of study. The Academic Advisory Committee guides the PhD student’s work through the successful completion of a qualifying examination. A letter signed by the academic adviser and approved by the department head is placed in the student’s file, indicating the composition of the Academic Advisory Committee.

**Dissertation Committee**: The Dissertation Committee is formed immediately after the student passes the qualifying examination. It comprises a major adviser, a dissertation adviser and a minor adviser for each minor the student has pursued. Additional faculty members may also be on the Dissertation Committee. The Dissertation Committee may be the same as the Academic Advisory Committee, or may be different. The Dissertation Committee guides the student’s course and research work after the student has passed the qualifying examination. The Dissertation Committee must be formally assigned and approved by the department head and filed with the Office of Graduate Academics. The major adviser must be a fulltime faculty member of the Department of Civil Engineering. The major and dissertation advisers may be the same individual.

**Doctoral Degree Requirements**

To earn a PhD in Transportation Planning and Engineering, the following requirements must be met:
• Fifty-one credits of graduate work (not including the PhD dissertation) in relevant major and minor areas of study beyond the bachelor’s degree, with an average grade of B or better (cumulative average of 3.0 or better on a 0-4 scale).
• Completion and successful defense of a 24-credit dissertation related to the major area of study. Dissertations must consist of original research that meaningfully advances the state-of-art in the subject area of the research and should result in the publication of at least one paper in a strictly peerreviewed technical journal related to the subject. A grade of B or better must be achieved for the dissertation.
• Completion of two minor areas of study, each consisting of between 9 and 12 credits of graduate work. At least one minor area must be outside the transportation area.
• Residency requirements for the PhD in Transportation Planning and Engineering include the 24-credit dissertation plus a minimum of 9 credits of applicable graduate course work taken at Polytechnic.

In satisfying the 51-credit course requirement, the student must satisfy all requirements for the major and minor areas selected, or their equivalent.

In satisfying these basic PhD requirements, students must also satisfy one of the two following conditions:

• Thirty-nine credits of approved graduate course work, not including individual guided studies (readings, projects, theses, etc.) beyond the bachelor’s degree, with an average grade of B or better (cumulative average of 3.0 or better on a 0-4 scale).
• Twenty-one credits of related graduate course work beyond the master’s degree, with an average grade of B or better (cumulative average of 3.0 or better on a 0-4 scale).

Satisfying condition 2 requires that the department accept the student’s MS degree in toto without regard to its specific content. This requires a recommendation from the department’s Graduate Committee and the approval of the department head.

Transfer Credits

Transfer credits for PhD students can be awarded course by course. Alternatively, a MS degree from another institution may be accepted for transfer in toto. In the former case, a maximum of 42 credits of approved graduate work may be transferred. The latter requires a recommendation from the department’s Graduate Committee and the approval of the department head. Transfer credits are awarded generally at the time of admission and must be approved by the academic adviser, the transportation graduate coordinator and the department head.

Qualifying Examination

Departmental qualifying examinations for the PhD in Transportation Planning and Engineering are given once a year (usually in June or July) and are coordinated with other qualifying examinations in the department. If sufficient demand exists, a second qualifying examination may be scheduled in December or January. Every PhD student must pass a qualifying examination in the major area of study and in any in-department minor areas of study before becoming a candidate for the PhD. Further:

• No student may register for dissertation credits until the Qualifying Examination is passed.
• A Dissertation Committee cannot be formed until the student passes the Qualifying Examination.
• A student may take the Qualifying Examination twice. A third attempt is permitted only with the written recommendation of the Academic Advisory Committee and the approval of department head. In no case may a student take the examination more than three times.
• Students normally take the Qualifying Examination (for the first time) after successfully completing most of their course requirements in the major and in-department minor areas of study.

The Qualifying Examination consists of a five-hour written portion and an oral portion of approximately one hour. Both written and oral portions of the examination focus on the student’s major and in-department minor. The oral portion may also explore higher-level skill areas required to successfully conduct independent research. Students are deemed to have passed the examination based upon an overall evaluation of the written and oral results. While some students may not be invited to the oral examination if they have done poorly in the written portion, invitation to the orals does not imply that the student has “passed” the written portion of the exam.
The Qualifying Examination is either “passed” or “failed.” A letter indicating the result of each examination is placed in the student’s graduate file. In rare cases, a student may be deemed to have “conditionally passed” the Qualifying Examination. This conditional status occurs in cases where the student does extremely well in all areas except for a single subject area in which weakness has been noted. Such students must follow a prescribed plan to strengthen their knowledge and skills in the area of weakness and must pass a special examination on the area of weakness within one calendar year. A student who has “conditionally passed” the Qualifying Examination may register for dissertation credits and may form a Dissertation Committee.

All transportation faculty members participate in submitting written problems for the qualifying examination, and in the grading process and in the oral examination. All departmental faculty members are welcome to observe any oral examination and to ask pertinent questions. Each student’s Academic Advisory Committee will have the opportunity to review the entire exam before it is administered and may suggest changes if it deems that the examination as presented is an inequitable test of the student’s abilities. Recommendations on the results of the examination are submitted by each student’s Academic Advisory Committee, augmented by any departmental faculty in the subdisciplines tested. The departmental faculty, acting as a whole, votes to accept or reject such recommendations at a meeting scheduled for this purpose.

**Dissertation Proposal**

Following passage of the Qualifying Examination and the appointment of a Dissertation Committee, the PhD candidate must submit a written Dissertation Proposal, outlining the subject of the proposed research. This proposal should be between 15 and 20 pages long and should address the following specific items:

- Description of the topic
- Literature review sufficient to insure that the work contemplated is original
- Research methodology(ies) to be used
- Data and/or laboratory needs and their availability to the student
- Anticipated outcomes

The Dissertation Proposal must be submitted within one semester of full-time study, or before 9 credits of dissertation credit are completed.

The Dissertation Proposal is orally presented and defended before the Dissertation Committee and other interested departmental faculty. The date of the oral defense and copies of the draft Dissertation Proposal must be made available to department faculty at least two weeks (14 calendar days) before the defense.

When the Dissertation Proposal is formally accepted, the Dissertation Adviser enters a letter into the student’s graduate file, indicating this acceptance, with a copy of the proposal. While the Dissertation Committee has reasonable flexibility to modify the proposal during the research, any significant change in focus area or methodology requires that an amended Dissertation Proposal be written and formally accepted following the same procedure noted herein.

**Dissertation Defense**

The culmination of the student’s PhD work is the oral presentation and defense of the final draft dissertation. A defense is generally scheduled after the Dissertation Committee has reviewed the draft dissertation and determined that it is complete and of sufficient quality to be presented and defended.

The defense is organized and scheduled by the Dissertation Committee. All Institute faculty members are invited to observe and ask questions at all Polytechnic dissertation defenses. Therefore, the date of the defense must be announced Institute-wide at least one month before the event, and copies of the draft dissertation must be available to any faculty member requesting one in a timely fashion and in no case less than two weeks before the defense.

**Course Descriptions**
A Brief Guide to Course Descriptions

Each program described in this catalog contains detailed descriptions of the courses offered within the program.

The first line gives the official course number for which students must register and the official course title. The letters indicate the discipline of the course and the first number of the official course numbers indicates the level of the course. The levels are as follows:

- 1XXX - Freshman Level
- 2XXX - Sophomore Level
- 3XXX - Junior Level
- 4XXX - Senior Level
- 5XXX to 9XXX - Graduate level

Typically the last number of the course number indicates the number of credits. The breakdown of periods of the course is also listed.

The paragraph description briefly indicates the contents and coverage of the course. A detailed course syllabus may be available by request from the office of the offering department.

“Prerequisites” are courses (or their equivalents) that must be completed before registering for the described course. “Corequisites” are courses taken concurrently with the described course.

The notation “Also listed…” indicates that the course is also given under the number shown. This means that two or more departments or programs sponsor the described course and that students may register under either number, usually the one representing the student’s major program. Classes are jointly delivered.

Aerospace Engineering

Aerospace Engineering

AE 4603 Compressible Flow

3 Credits This course covers conservation equations for inviscid flows, one-dimensional flows, normal shock waves, one-dimensional flow with friction, one-dimensional flow with heat addition, oblique shock waves and Prandtl-Meyer expansion waves.

Prerequisite(s): ME 3333 and ME 3313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
AE 4613 Aerodynamics

3 Credits The course explores incompressible inviscid flow, rotational and irrotational flow, elementary flows and their superposition, airfoil and wing geometry, aerodynamic forces and moments, thin airfoil theory, camber effects, incompressible laminar and turbulent boundary layer, vortex system, incompressible flow about wings, wing/body configurations, compressible flows past airfoils and wings and high-lift devices.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

AE 4633 Aerospace Propulsion

3 Credits This course looks at operation, performance and design methods for flight-vehicle propulsion, air-breathing engines, ramjets, turbojets, turbofans and their components, elements of solid and liquid rocket-propulsion systems.

Prerequisite(s): AE 4603.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

AE 4653 Aircraft Flight Mechanics

3 Credits The course examines development of equations of motion. Topics: Characteristics of aircraft-propulsion systems; Level flight performance of turbojet and propeller-driven aircraft; Unaccelerated climbing flight and aircraft ceiling; Takeoff and landing performance; Longitudinal and lateral static stability; Linearized equations of motion; Longitudinal and lateral modes of motion.

Prerequisite(s): ME 3223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Anthropology

Anthropology

AN 2383 Jade, the Stone of Heaven

3 Credits Four cultures-civilizations around the world have discovered jade and considered it a sacred substance, divine and useful. In Pre-Columbian Mesoamerica jade symbolized the state and the authority of the gods, and was a useful material more precious than gold. In the Middle Kingdom, or China, jade was the magical “Stone of Heaven,” celebrated from prehistory into modern times. Jade is found in Neolithic graves, and small disks of fine white jade were set in the gold medals of the recent Chinese Olympics. This course summarizes how jade fit into several cultures and civilizations around the world, with emphasis on historical and modern China.
AN 2883 The Upper Paleolithic and the Evolution of Modernity

3 Credits During the last decade, archaeology and anthropology began to intensively study the evolution of the Upper Paleolithic period, which lasted from roughly 40 thousand years ago until about 10,000 years ago. This period coincides with the last part of the Pleistocene glacial epoch. The Upper Paleolithic was followed by the Mesolithic and the Neolithic revolution, which saw the invention of agriculture and animal husbandry and the unfolding of recent human cultures and civilizations. We shall investigate how new scholarship casts the Upper Paleolithic as a time of intensive cultural and social growth when the human species witnessed its ascent into “modernity.” This scholarship casts modernity in a novel sense as the time in which humans forged new modes of cultural and ecological adaptation into present-day hunting and gathering societies. This new scholarship will help researchers to understand the Upper Paleolithic as the most salient shaper of human nature and action.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.  
Note: Satisfies a humanities and social sciences elective.

Art History

AH 2113 History of Art as Techné

3 Credits This introduction to Western Art in different historical periods focuses on pre-20th-century art. The course samples important periods and themes in art history, from ancient Egypt and archaic Greece to the present. This course also enhances cultural, social and aesthetic understanding through intensive engagement with a variety of visual forms in different historical periods. In addition, the course focuses on technological and social developments that drive creative innovation.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.  
Note: Satisfies a humanities and social sciences elective.

AH 3113 Contemporary Art, Electronic Art and Technology

3 Credits This audiovisual lecture course focuses on contemporary international art. Each week will feature a selected media element (film, video or audio) to illustrate the focus of the session, a required reading assignment and a discussion period.

Prerequisite(s): AH 2113.  
Note: Satisfies a humanities and social sciences elective.
**AH 4911 Special Topics in Art History**

*Variable Credits* This advanced seminar explores a specific topic in historical or contemporary art history. Students are expected to participate actively through seminar presentations on specific subjects and through vigorous class discussion and debate.

*Prerequisite(s):* AH 3113.
*Note: Satisfies a humanities and social sciences elective.*

**AH 4912 Special Topics in Art History**

*Variable Credits* This advanced seminar explores a specific topic in historical or contemporary art history. Students are expected to participate actively through seminar presentations on specific subjects and through vigorous class discussion and debate.

*Prerequisite(s):* AH 3113.
*Note: Satisfies a humanities and social sciences elective.*

**AH 4913 Special Topics in Art History**

*Variable Credits* This advanced seminar explores a specific topic in historical or contemporary art history. Students are expected to participate actively through seminar presentations on specific subjects and through vigorous class discussion and debate.

*Prerequisite(s):* AH 3113.
*Note: Satisfies a humanities and social sciences elective.*

---

**Bioengineering**

**Graduate Courses**

Course descriptions of biomedical engineering courses, as well as CM and CBE courses associated with the MS in Biomedical Engineering Program, are given below. Other courses that are not described below are listed in the Biomedical Engineering Program and can be found in the course descriptions by their departments elsewhere in this catalog.

---

**Bioengineering**

**Graduate Courses**

Course descriptions of biomedical engineering courses, as well as CM and CBE courses associated with the MS in Biomedical Engineering Program, are given below. Other courses that are not described below are listed in the Biomedical Engineering Program and can be found in the course descriptions by their departments elsewhere in this catalog.

**BE 871x Guided Studies in Biomedical Engineering**
Under faculty supervision, students study selections, analyses, solutions and presentations of biomedical engineering reports for problems in products, processes or equipment design, or other fields of biomedical-engineering practices. Conferences are scheduled. Master’s degree candidates are required to submit three unbound copies of their reports to advisers one week before the last day of classes. Credits: 6 total, each 3 credits.

Prerequisite(s): Degree status.

**BE 873x Research in Biomedical Engineering**

6 total, each 3 Credits Supervised by faculty, this course examines engineering fundamental or applied research in biomedical engineering. Conferences are scheduled. Master’s degree candidates are required to submit three unbound copies of their reports to advisers one week before the last day of classes.

Prerequisite(s): Degree status.

**BE 997x MS Thesis in Biomedical Engineering**

9 total, each 3 Credits The thesis for the master’s degree in biomedical engineering should report the results of an original investigation of problems in biomedical engineering or application of physical, chemical or other scientific principles to biomedical engineering. The thesis may involve experimental research, theoretical analyses or process designs, or combinations of them. Master’s degree candidates are required to submit four unbound copies to advisers before the seventh Wednesday before commencement. Registration of at least 9 credits required.

Prerequisite(s): Degree status.

**BE 6013 Molecular Immunology**

3 Credits The course familiarizes students with the body of research that underpins the understanding of the molecular basis and the cellular interactions that regulate immune responses. Topics: Antibody structure, B-cell development, T-cell structure and development, T-cell-MHC interaction, MHC structure and antigen processing, complement chemistry, complement and Fc receptor structure and function, transplantation immunogenetics, mucosal immunology and allergic reactions.

Prerequisite(s): Adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BE 6023 Cellular and Molecular Neuroscience**

3 Credits A three-part, comprehensive overview of cellular neuroscience, this course covers the physiology and biophysics of neurons; neuronal signal transduction, gene expression and transport of RNA and protein; and synaptic transmission and plasticity. The textbook is Fundamental Neuroscience by Zigmond, Bloom, Landis, Roberts and Squire. Supplementary readings are from other textbooks and journal articles.
Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6103 Anatomy, Physiology and Biophysics I

3 Credits Anatomy and Physiology are the sciences that identify body structures and how they function and interact, respectively. Therefore, academic training for biomedical engineering must include a sound, comprehensive knowledge of human anatomy and physiology. While the course emphasizes normal functions, it also considers the consequences of disease and injury and deals with the body’s potential for recovery and compensation. The Biophysics' component examine the underlying physical principles of organ function. Part I of this two-part sequence focuses on Cell Physiology and Homeostasis, Cardiac, Nervous, and Respiratory systems. The course will be taught using a “systems engineering” approach and introduce the design considerations for artificial organs. The material includes hands-on demonstration of technology to measure EEGs, EKG and respiratory function.

Prerequisite(s): Calculus, biochemistry, introductory gross and cellular anatomy.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6113 Anatomy, Physiology and Biophysics II

3 Credits Part II of this sequence focuses on the muscular, skeletal, renal and endocrine systems and includes discussions on skin and basic oncology. This part is taught using a same systems engineering and biophysics approach and link concepts from BE 6103. The material includes hands-on demonstration of technology to measure EMG and plasma glucose.

Prerequisite(s): BE 6103.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6203 Biomedical Imaging I

3 Credits This course introduces the physics, instrumentation and signal-processing methods used in X-ray imaging (projection radiography), X-ray computed tomography, nuclear medicine (SPECT/PET), ultrasound imaging and magnetic resonance imaging.

Prerequisite(s): Undergraduate-level courses in multivariable calculus, physics, and probability. Corequisite(s): undergraduate or graduate level signals and systems. Open to graduate students and upper-level UG students. Signals and systems (EE 3054, preferred but not required).
Also listed under: EL 5823.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6213 Biomedical Imaging II

3 Credits This course introduces the mechanisms and concepts related to image acquisition and subsequent image processing and image formation in biomedical imaging modalities. Building on material covered in Biomedical Imaging I, these courses focus on advanced topics such as functional magnetic resonance imaging (MRI), ultrasound imaging, biomagnetic imaging and optical tomographic imaging (OTI).
Prerequisite(s): BE 6203 (Biomedical Imaging 1, B).
Also listed under: EL 6823.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6223 Image Processing

3 Credits The course covers image formation and perception; image acquisition, representation and display; image sampling and resizing; contrast enhancement; two-dimensional Fourier transform and other unitary transforms; frequency domain and spatial domain linear filtering; median and morphological filtering; image smoothing, sharpening and edge detection through linear and nonlinear filtering; color image representation and processing; lossless and lossy-image coding techniques and standards, image deblurring; imaging geometry, image registration and geometric transformation. C- or MATLAB implementation of selected imaging-processing algorithms.

Prerequisite(s): Graduate student status or EE 3054 and MA 3012.
Also listed under: EL 5123.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6303 Bio-optics

3 Credits Recent growth in using optics technology for biomedical research and health care has been explosive. New applications are made possible by emerging technologies in lasers, optoelectronic devices, fiber optics, physical and chemical sensors and imaging—all of which are now applied to medical research, diagnostics and therapy. This sequence course on optics for biomedical students combines fundamental knowledge of the generation and interaction of electromagnetic waves with applications to the biomedical field. The goal is for this approach is to provide tools for researchers in bio-physics and to familiarize researchers, technologists and premed students with cutting-edge approaches.

Prerequisite(s): An undergraduate course in physics that includes electricity, magnetism and waves such as PH 2023 and multivariable calculus such as MA 2122 and MA 2122.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6403 Signals, Systems and Transforms

Prerequisite(s): Graduate status.
Also listed under: EL 6113.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6453 Probability Theory

Prerequisite(s): Graduate status and MA 3012.
Also listed under: EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BE 6483 Digital Signal Processing Laboratory**

This course includes hands-on laboratory experiments, lectures and projects relating to real-time, digital signal processing (DSP)systems using a DSP microprocessor. Students gain experience in implementing common algorithms used in a variety of applications and learn tools and functions important for designing DSP-based systems. Students are required to complete a project and give an oral presentation. This course is suitable for students interested in DSP and Embedded Systems.

Prerequisite(s): EL 6113 or Equivalent, C/C++.
Also listed under: EL 6183.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

**BE 6503 Biomedical Instrumentation**

This course, is for graduate students in the Bioengineering Program, introduces the principles of commonly used instruments in neuroscience research, particularly in electrophysiology and imaging. The course discusses theoretical considerations in choosing techniques as well as practical issues in selecting materials and designing experiments.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BE 6601 Introduction to Drug Delivery**

1.5 Credits This course introduces drug-delivery science focusing on the historical development of delivery methods, pharmacokinetics and pharmacodynamics of drug-delivery systems, routes of administration, devices for drug delivery and, briefly, on various targeting methods and delivery of gene- and protein based therapeutics.

Prerequisite(s): BTE 6013 or adviser’s approval.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BE 6603 Intro to Drug Delivery**
3 Credits The course provides an integrated approach to the basic and clinical science of drug delivery. Topics: the history drug delivery; kinds of drugs to be delivered, including genes and proteins; various targeting mechanisms; transport phenomena and thermodynamic concepts; pharmacokinetics of drug delivery, polymeric drug-delivery systems; various devices developed for controlled delivery.

Prerequisite(s): calculus with ordinary diff. eq.; undergraduate courses in biology, chemistry and physiology (minimum grade B).
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6653 Principles of Chemical and Biochemical Systems

3 Credits This introductory course for graduate engineering students focuses on fundamental knowledge of chemical and biochemical reactions. Students learn structure and function of biological molecules such as proteins, carbohydrates and DNA. They master basic concepts of structure-property relationships of macromolecules. Chemistries critical to biosensor technologies such as linking biological molecules to various supports, is described. Students appreciate and understand the wide range of chemical and biological molecules critical to living systems.

Prerequisite(s): Instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6703 Materials in Medicine

3 Credits The course focuses on the basic principles behind human-tissue response to artificial surfaces and materials; the general types of polymeric and metallic materials used in soft- and hard-tissue replacements; tissue engineering and drug-delivery devices; current approaches directed toward the engineering of cell-based replacement for various tissues; techniques to control the physiologic response to artificial surfaces; critical review of current biomaterials literature; current research in the field; evaluation of the design criteria that a material must meet for a biological application; and what is required for “biocompatibility.”

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6723 Natural Polymers and Materials

3 Credits This course introduces natural and biomimetic polymers with an interdisciplinary view of biology, chemistry and macromolecular science. Topics: Natural building blocks and methods by which nature carries out polymer synthesis and modification reactions; DNA; structural proteins; plant proteins; polysaccharides; polyesters; biosurfactants; polymers built from natural monomers and a wide variety of renewable resources; uses of polymers as fibers, films, rheological modifiers, flocculants, foams, adhesives and membranes; special applications of natural polymers in medicine and as biodegradable plastics.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 6753 Orthopaedic Biomechanics and Biomaterials
3 Credits The course provides fundamental knowledge of the relevant background science, theory, practice and materials required to provide modern orthopedic and trauma care. Students learn about biomaterials used in orthopedics and how materials engineering has made them increasingly sophisticated. The course covers important clinical applications as well as fundamental concepts in biomechanics of bone and other tissues; materials used; wear and corrosion during use; dental implants; joint-replacement devices; stress-strain analysis, beam theory; introduction to finite element analysis design for prosthesis; and more.

Prerequisite(s): Calculus with ordinary diff. eq. and BE 6703.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 9433 Protein Engineering

3 Credits This course introduces the modern protein engineering techniques that allow researchers to understand protein structure and function and to create new proteins for many purposes. This new field is at the interface of chemistry, biology and engineering. The first part of the course discusses the protein composition and structure, various genetic, biochemical and chemical techniques required to engineer proteins, which is followed by specific topics. Topics include designing proteins that are highly structured; that are active at high temperatures and in non-aqueous solvents; that interact selectively with other proteins, small molecules and nucleic acids for therapeutic purposes; and that catalyze new reactions.

Prerequisite(s): CM 9413 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 9443 Tissue Engineering

3 Credits This course teaches basic biological processes that occur during blood contact with artificial surfaces; how to critically read and review literature on tissue engineering; how to anticipate biocompatibility issues with a variety of implant devices students may later encounter; current approaches directed toward the engineering of cell-based replacements for various tissue types.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BE 9730 Colloquium in Biomedical Engineering

0 Credits Engineers and scientists from industry and academia present recent developments in biomedical engineering. Two and four semesters are required for master’s and PhD students, respectively.

Prerequisite(s): None.

BE 9740 Seminar in Biomedical Engineering

Students present research findings if engaged in MS or PhD thesis research, or make presentations from their critical analysis of recent biomedical-engineering publications. The seminar gives students the opportunity to prepare a scientific presentation on a biomedical-engineering topic of interest and to speak before their peers, who will question them.
BE 9753 Bioethics Seminar

3 Credits This graduate-level seminar course discusses the ethical issues relevant to today’s bioengineers and molecular and cell biologists. Topics include: Darwin’s theory of evolution; science and religion in twentieth-century America; Intelligent Design Theory; social Darwinism and the concomitant rise of eugenics in Europe and the U.S., the ways in which molecular genetics has challenged historical categories of race; the ethical, social, and legal implications of the Human Genome Project (specifically genetic privacy and testing, human genes and intellectual property); argobiotechnology and the science, ethics, and politics of genetically modified organisms (GMOs); and the science, politics, and ethics of human-embryonic-stem-cell research. The student is encouraged to think about the way in which debates concerning “nature versus nurture” have been framed historically, in order to understand current controversies over that distinction.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Bioinformatics

Bioinformatics

BI 997X MS Thesis in Bioinformatics

(As arranged) The course emphasizes original research, which serves as the basis for a master’s degree. The minimum research registration requirement for the master’s thesis is 9 credits. Registration for research is required each semester consecutively until students have completed adequate research projects and an acceptable thesis, and have passed required oral examinations. Research credits registered for each semester realistically reflect time devoted to research.

Prerequisite(s): For MS candidates; Degree status, consent of graduate adviser and thesis director.

BI 7513 Chemical Foundation for Bioinformatics

3 Credits This course intensively reviews those aspects of organic chemistry and biochemistry necessary to begin research in bioinformatics and to enter graduate courses in biology. Topics include covalent bonding, quantum mechanical basis of bond formation, three-dimensional structure of molecules, reaction mechanisms, catalysis, polymers, enzymes, thermodynamic and kinetic foundations, metabolic pathways, sequence and structure of macromolecules. This course extensively uses computer approaches to convey the essential computational and visual nature of material to be covered.

Prerequisite(s): General Chemistry, General Physics, Organic Chemistry and Calculus.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
**BI 7523 Biological Foundation for Bioinformatics**

*3 Credits* This course intensively reviews the aspects of biochemistry, molecular biology and cell biology necessary to begin research in bioinformatics and to enter graduate courses in biology. The areas covered include cell structure, intracellular sorting, cellular signaling (i.e., receptors), Cytoskelton, cell cycle, DNA replication, transcription and translation. This course extensively uses computer approaches to convey the essential computational and visual nature of the material to be covered.

*Prerequisite(s): General Chemistry, General Physics, Organic Chemistry, Calculus or permission of instructor.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7533 Bioinformatics I: Sequence Analysis**

*3 Credits* This course covers computer representations of nucleic acid and protein sequences; pair-wise and multiple alignment methods; available databases of nucleic acid and protein sequences; database search methods; scoring functions for assessment of alignments; nucleic acid to protein sequence translation and codon usage; genomic organization and gene structure in prokaryotes and eukaryotes; introns and exons; prediction of open reading frames; alternative splicing; existing databases of mRNA, DNA protein and genomic information; and an overview of available pro- grams and of Web resources.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7543 Bioinformatics II: Protein Structure**

*3 Credits* The course explores protein-folding representations; databases of protein-folding classes; secondary structure prediction; tertiary structure prediction via computer-folding experiments threading; homology model building; prediction of post translation modification sites; active and binding sites in proteins; representations of contiguous and non-contiguous epitopes on protein surfaces at the sequence level; representations of functional motifs at the three dimensional and at the sequence level.

*Prerequisite(s): BI 7533.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7553 Bioinformatics III: Functional Prediction**

*3 Credits* The course covers functional classifications of proteins; prediction of function from sequence and structure; Orthologs and Paralogs; rep- resentations of biological pathways; available systems for the analysis of whole genomes and for human-assisted and automatic functional prediction.

*Prerequisite(s): BI 7543.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7563 Chemoinformatics**

*3 Credits* This course features a review of database theory; chemical structure representation; connection tables, line notations and structure diagrams; representations of chemical reactions; structure manipulation: graph theory, structure analysis: ring perception, structural fingerprints, symmetry perception, molecular modeling algorithms, genetic algorithms, simulated
annealing, QSAR historical approaches, structural search of chemical databases, commercial chemical information databases, combinatorial chemistry and diversity assessment.

**BI 7573 Special Topics in Informatics in Chemical and Biological Sciences**

This course covers special topics on various advanced or specialized topics in chemo- or bioinformatics that are presented at intervals.

**BI 7583 Guided Studies in Bioinformatics I**

*3 Credits* This research/case course can be handled in different ways at the faculty adviser’s discretion. The course may involve a series of cases that are dissected and analyzed, or it may involve teaming students with industry personnel for proprietary or non-proprietary research projects. Generally, the student works under faculty supervision, but the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. Master’s degree candidates must submit an unbound copy of their report to adviser/s one week before the last day of classes. Credits: 6 total, each 3 credits.

*Prerequisite(s): Degree status.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7593 Guided Studies in Bioinformatics II**

*3 Credits* This research/case course can be handled in different ways at the faculty adviser’s discretion. The course may involve a series of cases that are dissected and analyzed, or it may involve teaming students with industry personnel for proprietary or non-proprietary research projects. Generally, the student works under faculty supervision, but the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. Master’s degree candidates must submit an unbound copy of their report to adviser/s one week before the last day of classes. Credits: 6 total, each 3 credits.

*Prerequisite(s): Degree status.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7613 Introduction to Systems Biology**

*3 Credits* This course explains the functioning of basic circuit elements in transcription regulation, signal transduction and developmental networks of living cells, using simplified mathematical models. The course focuses on design principles and information processing in biological circuits. It discusses network motifs, modularity, robustness, evolutionary optimization and error minimization by kinetic proofreading in specific applications to bacterial chemotaxis, developmental patterning, neuronal circuits and immune recognition in several well-studied biological systems.

*Prerequisite(s): BI 7543.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BI 7623 Systems Biology: -Omes and –Omics**
3 Credits This course summarizes knowledge in genomics, proteomics, transcriptomics, metabolomics and relative molecular technologies. Topics include an overview of technologies in functional genomics (DNA chip arrays); whole genome expression analysis (EST, MPSS, SAGE, arrays); proteome analysis technology (2D-electrophoresis, protein in situ digestion for mass spectrometric analysis, yeast 2-hybrid analysis, 2-D PAGE, MALDI-TOF spectroscopy); the principles of Nuclear Magnetic Resonance Spectroscopy and Mass Spectrometry technologies for metabolomics, including general principles, the strengths and weaknesses of each technique, the requirements for sample preparation and the options for the management of output data. This course explains how to exploit different -ome database resources for investigations via special practical tasks to lectures. Special attention is focused on nutrigenomics, a multidisciplinary science that uses genomics, transcriptomics and proteomics to study metabolic health. This relatively new area of metabolomics has the potential to contribute significantly to advances in nutrition and health.

Prerequisite(s): BI 7543 and BI 7553.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BI 7633 Microarray Analysis

3 Credits This course will train students how to analyze DNA microarrays experiments. In first part of the course, students will gain practical experience using R (Bio Conductor packages) in pre processing microarray data, normalization and summarizing expression data, putting data together for filtering, differential expression, clustering annotations to identify differentially expressed genes and relevant pathways. The second part of the course focuses on labs from Bio Conductor work-shops, review of computational approaches for studying gene expression data. Data mining techniques such as linear modeling for time course data analysis, learning algorithms like support vector machines for classification problems and meta-analysis across experiments are introduced.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BI 7643 Methods in Genome Computing

3 Credits This course is designed to introduce students to the Perl programming language, its bioinformatics toolbox BioPerl and Unix commands for processing high throughput genomic and/or proteomic data. The first part of the course deals with the fundamentals of Perl. The second part deals with sub- routines, object oriented Perl, and using BioPerl modules to perform sequence analysis and graphics rendering. Students also learn how to use BioPerl modules to set up an analysis pipeline.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BI 7843 Molecular Modeling and Simulation

3 Credits This course introduces principles and applications of modern molecular modeling and simulations methods, using commercial software packages on powerful computer workstations. Algorithms for visualizing and predicting structural and physical properties of molecules and molecular aggregates are taught, based on principles of quantum, classical and statistical mechanics, which are in a mathematically simplified form. Commercial software packages are applied to illustrative problems in physical chemistry, chemical engineering, biology and medicine.

Prerequisite(s): Completion of core undergraduate courses in mathematics and science (grade C or better) in CE, CM, CS, EE, ME or PH, or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
BIOL-GA 2030 Statistics in Biology

4 Credits Advanced course on techniques of statistical analysis and experimental design that are useful in research and in the interpretation of biology literature. Principles of statistical inference, the design of experiments, and analysis of data are taught using examples drawn from the literature. Covers the use of common parametric and nonparametric distributions for the description of data and the testing of hypotheses.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BIOL-GA 2303 Introduction to Biostatistics

4 Credits Introduction to probability and statistical methods utilized in the analysis and interpretation of experimental and epidemiological data. Statistical techniques associated with the normal, binomial, Poisson, t, F, and chi-squared distributions plus an introduction to nonparametric methods. Applications in biology, medicine, and the health sciences.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BMS 1004 Introduction to Cell and Molecular Biology

4 Credits The course covers the fundamentals of biology. Topics: Physical, chemical and biochemical bases of life on various organizational levels, cellular morphology, complementarily of form and function, including reproduction, development and genetics.
Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**BMS 2004 Introduction to Physiology**

*4 Credits* This course continues biology fundamentals. Topics: Emphasis on evolutionary theory, phylogeny and comparative physiology including homeostasis, regulation, integration and coordination of organisms at the systems level.

*Prerequisite(s): BMS 1004 or instructor’s permission.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**BMS 2512 Biostatistics**

*2 Credits* The course introduces statistical methods used in biology, including probability, statistical distributions, regression, correlation and tests.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BMS 3114 Genetics**

*4 Credits* The course covers the genetics of bacteria, viruses and high organisms. Emphasis is on both the genetic and biochemical analyses of gene replication, heredity, mutation, recombination and gene expression. Included are comparisons of prokaryotic and eukaryotic genetics and regulation. Laboratory techniques are used to study genetic phenomena in prokaryotes, eukaryotes and viruses. The course emphasizes modern approaches to genetic research. A Lab fee is required.

*Prerequisite(s): BMS 1004. Corequisite(s): CM 2213.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**BMS 3214 Microbiology**

*4 Credits* The course studies microbial organisms, especially bacteria and viruses. Topics: Microbial relationship to disease, infections and immunological processes. Mutation, transformation, transduction, induction and bioenergetic processes. Laboratory work includes experimental analysis of microbial structure and physiology by biochemical and cytochemical means. Also studied: Influence of environment on nutrition, enzymes and metabolism of representative microbial species. Lab fee required.

*Prerequisite(s): BMS 2004 and CM 1014 or instructor’s permission.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**BMS 3314 Advanced Cell and Molecular Biology I**
4 Credits This first semester of a year-long course explores the molecular basis of cell function and current trends in molecular biology. The lab component is a year-long project to locate, characterize, clone and express a gene. A Lab fee is required.

Prerequisite(s): CM 3314 and CM 2223 (see BMS 4324 for second semester).
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

BMS 4011 Senior Seminar

1 Credits In this course, students present seminars based on current literature.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BMS 4314 Advanced Cell Physiology

4 Credits The course analyzes chemical and physical mechanisms of cellular function. Topics: Molecular constituents of biological systems, enzymes and reaction rates, energetic and regulation of metabolic processes, membrane transport, contractility and irritability. Laboratory studies examine cellular components in terms of their functional activities (enzymes, oxidative-phosphorylation, photosynthesis), kinetics of soluble and membrane-bound enzymes and membrane transport. A Lab fee is required.

Prerequisite(s): BMS 2004 and CM 2614.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

BMS 4324 Advanced Cell and Molecular Biology II

4 Credits This is the second semester of a year-long course that examines the molecular basis of cell function and current trends in molecular biology. The lab component is a year-long project to locate, characterize, clone and express a gene. Lab fee required.

Prerequisite(s): BMS 3314.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

BMS 4414 Biophysics

4 Credits This course explores the molecular basis of complex biochemical functions, membrane transport, intercellular and extracellular signaling, metabolism and energy transduction, DNA, RNA and protein synthesis and control, macromolecular assemblies and special topics in biochemistry.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BMS 4814 Topics in Biology
BMS 4824 Topics in Biology

5 as arranged Credits

BMS 4834 Topics in Biology

6 as arranged Credits

BMS 4844 Topics in Biology

7 as arranged Credits

BMS 4914 Undergraduate Research in Biomolecular Science

4 Credits The course investigates problems in biology under faculty supervision. Library research, experimental studies and written reports are required. A Lab fee is required.

Prerequisite(s): Senior status or adviser’s approval, CM 4011 and CM 5040.

BMS 4924 Undergraduate Research in Biomolecular Science

4 Credits The course investigates problems in biology under faculty supervision. Library research, experimental studies and written reports are required. A Lab fee is required.

Prerequisite(s): Senior status or adviser’s approval, CM 4011 and CM 5040.

BMS 4934 Life Science Internship

4 Credits The internship comprises supervised projects in hospital, community or industrial settings. Students are evaluated on the basis of written and oral reports presented to faculty and outside project Co-sponsors. Faculty conferences and visits are required. Internships are open to senior students with approval of the departmental adviser. Planned experiences significantly expose students to relationships between theoretical information and practical applications.

Prerequisite(s): Senior status or adviser’s approval.
BMS 8011 Advanced Molecular Biology Laboratory

1.5 Credits The course covers the fundamentals of biology. Topics: Physical, chemical and biochemical bases of life on various organizational levels, cellular morphology, complementarily of form and function, including reproduction, development and genetics.

Corequisite(s): BMS 8013. This course is not open to students who have taken BMS 4324.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

BMS 8013 Advanced Molecular Biology

3 Credits Understanding the complex and dynamic interactions of cellular function. Topics include classical molecular biology (DNA, RNA and protein biosynthesis), recombinant DNA and genetic engineering, interactions of macromolecules and regulation of biologic systems. This course is not open to students who have taken BMS 4324.

Prerequisite(s): Instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BMS 8021 Advanced Cell Biology Laboratory

1.5 Credits Provides students with practical experience in some key cell and molecular biology techniques, including analysis of different cell types, cell differentiation, PCR, transformations and selection of cell lines with particular features. The course covers proper data handling and reporting techniques. This course is not open to students who have taken BMS 3314.

Corequisite(s): BMS 8023.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

BMS 8023 Advanced Cell Biology

3 Credits Understanding cell biology through the biochemistry of the cell, with emphasis on the structure and function of the cell and its organelles. Advanced theories of cytoskeletal proteins, cell junctions and matrix, protein signaling and cell death will be covered. This course is not open to students who have taken BMS 3314.

Prerequisite(s): Instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Biotechnology

Biotechnology
BE 6253 Biosensors

3 Credits This course discusses various biosensors, which consist of bio-recognition systems, typically enzymes or binding proteins such as antibodies immobilized onto the surface of physico-chemical transducers. Immuno-sensors, which use antibodies as their biorecognition system, are also discussed. Other bio-recognition systems covered are nucleic acids, bacteria and whole tissues of higher organisms. Specific interactions between the target analyte and the complementary bio-recognition layer that undergoes a physicochemical change are ultimately detected and measured by the transducer. Various transducers, which can take many forms depending upon the parameters measured (electrochemical, optical, mass and thermal changes) are also covered.

Prerequisite(s): CM 1004 General Chemistry for Engineers, CM 2213 Organic Chemistry I, CM 2614 Physical Chemistry I, and CM 9413 Biochemistry I

BT 6013 Biotechnology and the Pharmaceutical Industry

3 Credits The course offers an in-depth look at the modern process of drug development, from the early stage of target identification and generation of lead compounds to regulatory approval, and the role of biotechnology in this complex process. All the key aspects, including preclinical development, clinical trials and regulatory requirements, are covered with considerable contributions from pharmaceutical professionals. Real-life case studies are presented to illustrate critical points in the development process. Major classes of biotech drugs are briefly discussed. Many course lectures are delivered by scientists from the major U.S. pharmaceutical companies.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BT 6023 Biotechnology and Health Care

3 Credits Biotechnology’s contribution to modern health care stretches far beyond developing new therapeutic entities. This course provides an overview of key cutting-edge technologies such as stem-cell research and therapeutic cloning and demonstrates how their applications change “the conventional” in terms of availability of new treatments, monitoring services and diagnostics. The course also examines the implications of Human Genome Project for health care and the role of genetics and epigenetic modifications of genes in health and disease. The role of biotechnology in managing a number of sociologically high-impact diseases in developed and developing countries is highlighted.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BT 6033 Biosensors and Biochips

3 Credits Biosensors and biochips is one of the most exciting, complex and fast-growing areas of biotechnology today—the interface between biotechnology, nanotechnology and micro-electronics industries. The course covers both conventional biosensors based on whole cells, nucleic acids, antibodies and enzymes (e.g., enzymatic glucose monitoring) as well as new and emerging technologies related to designing, fabricating and applying multi-array biochips and micro-fluidic systems (lab-on-the-
The goal is to familiarize students with basic principles of biosensors design and applications. The course also covers practical applications of this technology in health care, medical diagnostics, defense and other areas.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BT 6043 Biocatalysis in Industry**

*3 Credits* The course focuses on the commercial use of biological catalysts across various industry segments, including pharmaceuticals, health care, fine chemicals and food. The course combines a broad overview of technologies with industrial insights into the economics of bio-processing. The course also covers emerging biomaterials trends. Case studies are presented to facilitate analysis, formulate trends and underline major challenges.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BT 7011 Special Topics in Biotechnology**

*1.5 Credits* Special Topics include courses covering particular subject/technology to help students to gain more knowledge in an area they may want to specialize in after graduation.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BT 7013 Special Topics in Biotechnology**

*3 Credits* Special topics include courses, designed to aid students in gaining extra knowledge/ specialization in a subject area of their choice.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BT 8713 Guided Studies in Biotechnology I**

*3 Credits* Special project (experimental, theoretical, computational, or literature search). Only one guided study course allowed per semester.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**BT 8723 Guided Studies in Biotechnology II**
3 Credits Special project (experimental, theoretical, computational, or literature search). Only one guided study course allowed per semester.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BT 9053 Enzyme Catalysis in Organic Synthesis

3 Credits The course provides a working knowledge of how to use biotransformations as a tool in organic chemistry. Students learn about general enzymatic reaction types that carry out the cleavage and formation of C-O bonds, P-O bonds, C-N bonds, C-C bonds, reduction reactions, oxidation reactions and isomerizations. Students also are taught advanced principles that apply to catalytic-protein engineering.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BT 9433 Protein Engineering

3 Credits This course introduces modern protein engineering techniques available to researchers to understand protein structure and function and to create entirely new proteins for many purposes. This new field lies at the interface of chemistry, biology and engineering. The first section discusses protein composition and structure, and various genetic, biochemical and chemical techniques required to engineer proteins, followed by specific topics. Topics include designing highly structured proteins that are active at high temperatures and in non-aqueous solvents; that interact selectively with other proteins, small molecules and nucleic acids for therapeutic purposes; and that catalyze new reactions.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BT 9443 Tissue Engineering

3 Credits This course covers basic biological processes that occur during blood contact with artificial surfaces; how to critically read and review literature about tissue engineering; how to anticipate bio-compatibility issues relevant to a variety of implant devices students may later encounter; and current approaches directed toward the engineering of cell-based replacements for various tissue types.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Biotechnology and Entrepreneurship

Biotechnology and Entrepreneurship
BTE 6013 Biotechnology and the Pharmaceutical Industry

3 Credits The course looks at the modern process of drug development in depth—from the early stage of target identification and generation of lead compounds to regulatory approval, and the role of biotechnology in this complex process. The course, featuring significant participation by industry professionals, covers all key aspects, including preclinical development, clinical trials and regulatory requirements. Real-life case studies illustrate critical points in the development process. Major classes of biotech drugs are briefly discussed. Many lectures are delivered by scientists from major U.S. pharmaceutical companies.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BTE 6023 Biotechnology and Health Care

3 Credits The contribution of biotechnology to modern health care stretches far beyond developing therapeutic entities. This course provides an overview of key cutting-edge technologies such as stem-cell research and therapeutic cloning and demonstrates how their applications change “the conventional” for the availability of new treatments, monitoring services and diagnostics. The course also examines the implications of Human Genome Projects for health care and the role of genetics and epigenetic modifications of genes in health and disease. The role of biotechnology in managing several sociologically high-impact diseases in developed and developing countries is highlighted.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BTE 6033 Biosensors and Biochips

3 Credits Biosensors and biochips are two of the most exciting, complex and fast-growing areas of biotechnology today—the interface between biotechnology, nanotechnology and microelectronics industries. The course covers conventional biosensors based on whole cells, nucleic acids, antibodies and enzymes (e.g. enzymatic glucose monitoring) as well as new and emerging technologies related to designing, fabricating and applying multi-array biochips and micro-fluidic systems (lab-on-the-chip). The goal is to familiarize students with basic principles of biosensors design and applications. The course also covers practical applications of this technology in health care, medical diagnostics, defense and other areas.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BTE 6043 Biocatalysis in Industry

3 Credits Biosensors and biochips is one of the most exciting, complex and fast-growing areas of biotechnology today—the interface between biotechnology, nanotechnology and microelectronics industries. The course covers conventional biosensors based on whole cells, nucleic acids, antibodies and enzymes (e.g. enzymatic glucose monitoring) as well as new and emerging technologies related to designing, fabricating and applying multi-array biochips and micro-fluidic systems (lab-on-the-chip). The goal is to familiarize students with basic principles of biosensors design and applications. The course also covers practical
applications of this technology in health care, medical diagnostics, defense and other areas.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BTE 9503 Project in Biotechnology and Entrepreneurship

3 Credits This practical course offers students the opportunity to apply practically their knowledge and skills to analyzing technology, preparing their own business plans or working at an early stage biotech company. The student can sign up for up to three projects (one per semester).

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BTE 9513 Project in Biotechnology and Entrepreneurship

3 Credits This practical course offers students the opportunity to apply practically their knowledge and skills to analyzing technology, preparing their own business plans or working at an early stage biotech company. The student can sign up for up to three projects (one per semester).

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

BTE 9523 Project in Biotechnology and Entrepreneurship

3 Credits This practical course offers students the opportunity to apply practically their knowledge and skills to analyzing technology, preparing their own business plans or working at an early stage biotech company. The student can sign up for up to three projects (one per semester).

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CP 101 Cooperative Education Seminar
CP 201 1st Work Experience

0 Credits

Chemical and Biomedical Engineering

CBE 401X Special Topics in Chemical and Biomolecular Engineering

(variable) Credits Topics of special interest in chemical and biomolecular engineering are explored.

Prerequisite(s): CBE 3313 or adviser’s approval.

CBE 481X Chemical Engineering Project

(up to 4 credits) Credits Students and faculty supervisors select independent chemical and biomolecular engineering projects. Not open to honors or senior thesis students. (X = 1, 2, 3 or 4 and designates the number of credits.)

Prerequisite(s): Adviser’s approval.

CBE 482X Chemical Engineering Project

(up to 4 credits) Credits Students and faculty supervisors select independent chemical and biomolecular engineering projects. Not open to honors or senior thesis students. (X = 1, 2, 3 or 4 and designates the number of credits.)

Prerequisite(s): Adviser’s approval.

CBE 491X Bachelor’s Thesis in Chemical and Biomolecular Engineering

(up to 4 credits) Credits In this course, students plan original problem investigations in chemical and biomolecular engineering guided by a faculty supervisor. A thorough literature search is required. Special apparatus is constructed as required for experimental work. (X = 1, 2, 3 or 4 and designates the number of credits.)
Prerequisite(s): Adviser’s approval.

CBE 492X Bachelor’s Thesis in Chemical and Biomolecular Engineering

(up to 4 credits) Credits In this course, students plan original problem investigations in chemical and biomolecular engineering guided by a faculty supervisor. A thorough literature search is required. Special apparatus is constructed as required for experimental work. (X = 1, 2, 3 or 4 and designates the number of credits.)

Prerequisite(s): Adviser’s approval.

CBE 902X Guided Studies in Chemical Engineering

3 Credits These studies involve selections, analyses, solutions and presentations of engineering reports of problems in products, processes or equipment design, or other fields of chemical engineering practices under faculty supervision. Conferences are scheduled. Master’s-degree candidates are required to submit three unbound copies of their reports to advisers one week before the last day of classes.

Prerequisite(s): Adviser’s approval.

CBE 903X Guided Studies in Biomolecular Engineering

3 Credits These studies involved selections, analyses, solutions and presentations of engineering reports of problems in products, processes or equipment design, or other fields of biomolecular engineering practices under faculty supervision. Conferences are scheduled. Master’s-degree candidates are required to submit three unbound copies of their reports to adviser one week before the last day of classes.

Prerequisite(s): Adviser’s approval.

CBE 997X MS Thesis in Chemical & Biological Engineering

(9 credits total, 3 each) Credits Theses for the master’s degree in chemical engineering should give results of original investigation of problems in chemical engineering or the application of physical, chemical or other scientific principles to chemical engineering. Theses may involve experimental research, theoretical analyses or process designs, or combinations thereof. Master’s-degree candidates are required to submit four unbound copies to advisers before the seventh Wednesday before commencement.

Prerequisite(s): Adviser’s approval.

CBE 999X PhD Dissertation in Chemical & Biological Engineering
Credits Theses for the PhD degree must give results of independent investigations of problems in chemical engineering and may involve experimental or theoretical work. Theses must show ability to do creative work and must show that original contributions, worthy of publication in recognized journals, are made to chemical engineering. Candidates are required to take oral examinations on thesis subjects and related topics. Doctoral-degree candidates must submit five unbound thesis copies to advisers before or on the seventh Wednesday before commencement.

Prerequisitese: Passing grade for RE 9990 PhD Qualifying Exam, graduate standing, and dissertation advisor approval

CBE 1002 Introduction to Chemical and Biomolecular Engineering

2 Credits This course introduces the chemical and biomolecular engineering profession, its history and its career potential. The course contains selected topics on basic chemical and biomolecular engineering and seminars covering the full range of chemical and biomolecular engineering profession from emerging areas to those found in more traditional positions.

Prerequisitese: CM 1014 and EG 1003.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 2124 Analysis of Chemical and Biomolecular Processes

4 Credits This course prepares students to formulate and solve material and energy balances on chemical and biomolecular process systems and lays the foundation for subsequent courses in thermodynamics, unit operations, kinetics and process dynamics, and control. The course introduces the fundamental engineering approach to problem solving: breaking down a process into its components, establishing the relations between known and unknown process variables, assembling the information needed to solve for the unknowns and, finally, obtaining the solution using relevant computational methods.

Prerequisitese: CM 1014 and MA 1024.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 3153 Chemical and Biomolecular Engineering Thermodynamics

3 Credits This course covers thermodynamics of flow systems. Topics include properties of fluids with advanced equations of state; properties of non-ideal mixtures; activity-coefficient models for non-electrolyte and electrolyte solutions; phase-equilibrium calculations at low and elevated pressures by computer procedures; and chemical reaction equilibria.

Prerequisitese: CBE 2124 and CM 2614.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 3223 Kinetics and Reactor Design

3 Credits This course provides the fundamentals of thermodynamics and kinetics of chemical and biomolecular reactions and the development of skills to analyze and design reactor systems. Typical topics include homogeneous and heterogeneous reactors of various types, catalyzed and non-catalyzed reactors, and the design of single and cascaded chemical and bio-reactors.
**CBE 3233 Chemical and Biomolecular Engineering Separations**

3 Credits This course introduces processes for chemical and biomolecular separations. Topics include thermodynamics of separation processes, and the analysis and design of processes such as distillation, absorption, extraction and crystallization. Analytical and computer techniques are emphasized.

Prerequisite(s): CBE 3153 and CBE 3313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CBE 3313 Transport I**

3 Credits This course establishes fundamental concepts in momentum and mass transfer and their applications in chemical and biomolecular systems. Topics in Momentum Transfer include macroscopic (integral) balances on finite control volumes of fluids (determination of inflow, outflow quantities), and microscopic (differential) balances on infinitesimal volumes of fluids (determination of fluid velocity profiles and pressure profiles). Topics in Mass Transfer include diffusion and convection with applications in separation processes and biomolecular systems.

Prerequisite(s): MA 2132 and CBE 2124.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CBE 3323 Transport II**

3 Credits This course expands understanding in mass transfer, establishes fundamental concepts in heat transfer, and introduces engineering aspects of transport. Topics in Mass Transfer include diffusion-limited reactions with applications in biomolecular systems, transport in porous media, and mass transfer across membranes with applications in chemical and biomolecular systems. Topics in Heat Transfer include the basic mechanisms of conduction and convection. Topics in engineering aspects of transport include flow in closed conduits, heat-transfer equipment, and examples of simultaneous Heat and Mass Transfer.

Prerequisite(s): CBE 3313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CBE 4113 Engineering Laboratory I**

3 Credits This course introduces the performance of experiments in unit operations, transport processes and unit processes. Students analyze and design experiments to meet stated objectives. Results are presented in written and oral form.

Prerequisite(s): CBE 3233.
Weekly Lecture Hours: 1 | Weekly Lab Hours: 6 | Weekly Recitation Hours: 0
CBE 4143 Process Dynamics and Control

3 Credits This course introduces system dynamics and process control. Dynamic models of chemical processes are developed. The design and tuning of feed-back and feed-forward controllers are discussed, and students are introduced to multiple input/multiple output systems and large system control issues.

Prerequisite(s): CBE 3233
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 4163 Chemical and Biomolecular Process Design I

3 Credits This course provides the skills to synthesize and design chemical and biomolecular processes with considerations of site and process selections, process economics, construction materials, data requirements and acquisition flow sheeting and subsystems. Students receive computer procedures and case studies to gain experience in process simulation and analysis.

Prerequisite(s): CBE 3223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 4173 Polymeric Materials

3 Credits This course examines processing, structure, properties and applications of polymers as engineering materials, including renewable-resource based biopolymers. Topics include fundamentals of processing-morphology/property correlations in materials, basic concepts of viscoelasticity, fracture behavior, and thermal and electrical properties of engineering polymeric materials.

Prerequisite(s): CBE 3223 and CBE 3313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 4213 Engineering Laboratory II

3 Credits This course deals with continued experiments in unit operations, transport processes and process control. Students analyze and design experiments to meet stated objectives. Results are presented in writing and orally.

Prerequisite(s): CBE 4113 and CBE 4143.
Weekly Lecture Hours: 1 | Weekly Lab Hours: 6 | Weekly Recitation Hours: 0

CBE 4263 Chemical and Biomolecular Process Design II

3 Credits This course provides the skills to optimally design industrial processes, synthesizing knowledge from previous chemical and biomolecular engineering courses. Students receive more advanced computer procedures and work on case studies to gain further experience in process simulation and analysis. Design projects are conducted in teams similar to those in industry.

Prerequisite(s): CBE 4163 and CBE 4143.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CBE 4954 Chemical and Biomolecular Engineering Internship

4 Credits This internship is a supervised, creative engineering experience of at least two months’ duration, typically taken during the summer, culminating in written and oral reports presented to industrial and faculty supervisors. Faculty visitations and conferences during internships are arranged.

Prerequisite(s): Senior standing and adviser’s approval.

CBE 6153 Applied Mathematics in Engineering

3 Credits This course covers mathematical formulation of chemical engineering problems in terms of ordinary and partial differential equations. Topics include solutions of boundary and initial value problems using Green’s functions and other techniques; characterization of second-order partial differential equations and properties of their solutions; asymptotic methods and numerical techniques.

Prerequisite(s): MA 2122 and MA 2132 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 6333 Transport Phenomena

3 Credits The topics in this course include vector analysis review; diffusive fluxes; conservation equations for chemical species and thermal energy; boundary conditions; scaling and approximation techniques; solution methods for conduction and diffusion problems; transient unidirectional diffusion and conduction; momentum diffusion and viscous stress; conservation equation for momentum and the Navier-Stokes equations; unidirectional and lubrication flows; and low-Reynolds and high-Reynolds number flows.

Prerequisite(s): CBE 3313 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 6733 Chemical Engineering Thermodynamics

3 Credits This course covers advanced treatment of phase and chemical equilibria; ideal and nonideal solutions; stability of thermodynamic systems; osmotic pressures; electrolyte solutions; solid-liquid equilibria; and biochemical applications.

Prerequisite(s): CBE 3153 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 6813 Chemical Reactor Analysis and Design

3 Credits The topics in this course include trends and issues in modern reactor design; kinetics of complex homogenous and heterogeneous reactions; determination of nonlinear kinetic parameters, effects of transport processes, and catalyst deactivation; analysis and design of reactors; laminar flow reactors; dispersion model; split boundary condition problems; effects of non-ideal
flow on conversion; and fixed-bed, fluidized-bed and multiphase reactors.

**Prerequisite(s):** CBE 3223 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

---

**CBE 7213 Polymer Rheology and Processing**

3 Credits The topics in this course include science and engineering of polymer processing; Newtonian and non-Newtonian flow phenomena; molecular and phenomenological models of polymer rheology; experimental characterization of shear flows; and the theory and application of engineering principles to extrusion, Co-extrusion, blown film extrusion, injection molding and fiber spinning.

**Prerequisite(s):** CBE 3313 and CBE 3323 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

---

**CBE 7263 Engineering Physics of Synthetic and Biological Macromolecules**

3 Credits This course covers physical states of synthetic and biological macromolecules; sizes, shapes and ordered structures; dynamics of nonentangled and entangled chains; amorphous and crystalline solids, networks and gels; mechanical, dielectric and optical properties; and viscoelasticity and fracture.

**Prerequisite(s):** CBE 4173 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

---

**CBE 7283 Polymer Composites**

3 Credits This course covers composites of linear or cross-linked polymer matrix and reinforcing fibers: carbon, graphite, Kevlar and glass; manufacturing of composites; autoclave bag molding, filament winding, pultrusion; science and engineering of processing of composites; chemorheology, heat and mass transfer, residual stresses, monitoring and optimization of processing; mathematical models; in-situ real-time sensing; nanocomposites and “green” composites.

**Prerequisite(s):** CBE 4173 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

---

**CBE 7523 Air Pollution Engineering Control**

3 Credits This course covers control of air pollutants in response to government regulation, regeneration; pollutant-emissions control and the U.S. Clean Air Act mandates; EPA control-technology approaches, BACT, MACT and RACT; analysis of pollutant properties, concentrations and atmospheric boundary conditions; absorptive and reactive recovery processes for moving and stationary sources; and formation and removal of gaseous oxides (NOx, SOx, CO) of VOC’s, Hg and HAP’s) and of aerosols and other particulates.

**Prerequisite(s):** Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CBE 8113 Optimization in Biological Systems

3 Credits  This course introduces the mathematical programming approach. Topics include tree and network representations; review of the basic concepts in optimization; Kuhn-Tucker optimality conditions; non-linear programming algorithms; modeling techniques for formulating non-linear models; review of linear programming; modeling of continuous and discrete decisions; mixed-integer linear programming techniques (MILP); logical inference and MILP; mixed-integer non-linear programming algorithms (MINLP); applications in computational molecular biology; genotyping of pooled micro-satellite markers; genome rearrangement by DNA inversions; multiple alignment problems; optimization applications in protein systems; and optimization applications in metabolic networks.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 8313 Biointerfacial Engineering

3 Credits  This course explores design, physical properties and experimental analysis of interfaces from a bioengineering perspective. The course comprises about two-thirds lecture and onethird laboratory. Topics covered incorporate experimental characterization including electrochemical, optical and spectroscopic methods; the biochemistry of surfaces; physical properties including surface thermodynamics, electrostatics and biomolecular properties at interfaces; and select biotechnological applications.

Prerequisite(s): CBE 3323, CBE 3223, CM 3314 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 8373 Engineering Principles of Drug Delivery

3 Credits  This course covers fundamental concepts in drug delivery from an engineering perspective. Biological organisms are viewed as highly interconnected networks where the surfaces/interfaces can be activated or altered chemically and physically/mechanically. The course focuses on the importance of intermolecular and interfacial interactions on drug-delivery carriers. Topics include drug-delivery mechanisms (passive, targeted) for metastatic cancer, in particular, and for inflammatory-type-of-diseases, in general; therapeutic modalities and mechanisms of action; engineering principles of controlled release and quantitative understanding of drug transport (diffusion, convection); effects of electrostatics, macromolecular conformation and molecular dynamics on interfacial interactions; thermodynamic principles of self-assembly; chemical and physical characteristics of delivery molecules and assemblies (polymer based, lipid based); significance of biodistributions and pharmacokinetic models; toxicity issues and immune responses.

Prerequisite(s): CBE 3313 and CBE 3323 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 8813 Biochemical Engineering

3 Credits  This course covers biochemical and bioprocess engineering; enzyme kinetics; cellular control systems, genetic and protein engineering; metabolism, stoichiometry and metabolic engineering; cell growth kinetics; bioreactor design and operation; heat/mass transfer in biological system; and biological product purification and characterization.
Prerequisite(s): CBE 3223 and CBE 3233 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 9403 Selected Topics in Chemical and Biomolecular Engineering I

3 Credits Topics of special interest in chemical and biomolecular engineering are announced in advance in each semester offering.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 9413 Selected Topics in Chemical and Biomolecular Engineering II

3 Credits Topics of special interest in chemical and biomolecular engineering are announced in advance in each semester offering.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CBE 9910 Seminar in Chemical and Biomolecular Engineering

0 Credits Recent developments in chemical and biomolecular sciences and engineering are presented by engineers and scientists from industry and academia.

Note: Four semesters are required for PhD candidates.

CBE 9920 Seminar in Chemical and Biomolecular Engineering

0 Credits Recent developments in chemical and biomolecular sciences and engineering are presented by engineers and scientists from industry and academia.

Note: Four semesters are required for PhD candidates.

Chemistry
CM 1 Pre-college Chemistry

NC Credits The course covers mole concept and stoichiometry, gaseous molecular behavior, gas law equilibrium and Le Chatelaine’s principle.

| Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CM 471X Guided Studies in Chemistry

As arranged Special project (experimental, theoretical, computational or literature search). Maximum 6 credits (including the credits of BMS 471X) count toward the degree requirements.

Prerequisite(s): Adviser’s approval; CM 5040, if project involves experiments, and either CM 1004 or CM 1014.

CM 997X MS Thesis in Chemistry

variable, 1-9 Credits This course requires original experimental or theoretical research, guided by a chemistry faculty member that may serve as basis for an MS degree. The minimum research registration requirements for the master's thesis: 9 credits. Registration is required each semester consecutively until students complete adequate research projects and acceptable theses and have passed required oral examinations.

Prerequisite(s): Advisor approval

CM 999X PhD Dissertation in Materials Chemistry

36 credits minimum Credits This course requires original experimental or theoretical research, guided by a chemistry faculty member, that may serve as basis for a PhD. The minimum research registration requirement is 36 credits. Registration is required each semester consecutively until students complete adequate research projects and acceptable theses and have passed required oral examinations. A research fee is required.

Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam

CM 1004 General Chemistry for Engineers

4 Credits This is a one-semester introductory course in general chemistry. It covers chemical equations, stoichiometry, thermodynamics, gases, atomic and molecular structure, periodic table, chemical bonding, states of matter, chemical equilibrium, organic, inorganic and polymeric materials and electrochemistry.

Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 3 | Weekly Lab Hours: 2 | Weekly Recitation Hours: 1
CM 1004H General Chemistry for Honors Engineers

4 Credits A one-semester introductory course in general chemistry. Chemical equations, stoichiometry, thermodynamics, gases, atomic and molecular structure, periodic table, chemical bonding, states of matter, chemical equilibrium, organic, inorganic, polymeric materials and electrochemistry. A discussion of chemical innovations will be introduced where appropriate.

Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 3 | Weekly Lab Hours: 2 | Weekly Recitation Hours: 1

CM 1014 General Chemistry I

4 Credits This course covers chemical equations, chemical conservation laws, stoichiometry, thermochemistry, properties of gases, atomic structure, periodic table, chemical bonding and molecular structure. The course is required for students in the Biomolecular Science Program.

Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 3 | Weekly Lab Hours: 2 | Weekly Recitation Hours: 1

CM 1024 General Chemistry II

4 Credits This course covers states of matter, chemical thermodynamics and equilibria, kinetics, acid-base chemistry, electrochemistry, introduction to organic chemistry, natural and synthetic polymers. The course is required for students in the Biomolecular Science Program.

Prerequisite(s): CM 1004 or CM 1014. Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 3 | Weekly Lab Hours: 2 | Weekly Recitation Hours: 1

CM 1032 Chemistry, the Central Science

2 Credits This is a one-semester overview course in chemistry, providing examples of important discoveries and important chemical innovators, with a strong emphasis on cutting-edge research. Field opportunities are developed to allow students to contribute to the discipline.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 1101 Numerical Methods for Chemistry

1 Credits This is a one-semester introductory course in numerical methods needed for BMS and CM courses. Students learn spreadsheet calculation, chart displays, curve fitting and good lab-record keeping.

Corequisite(s): CM 1014.
Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 2102 Molecular Modeling in Chemistry

2 Credits This one-semester introductory course covers computer modeling of organic compounds. Students learn to use ChemDraw and Chem3D, standard applications in chemistry.

Prerequisite(s): CM 1101 and CM 2213; Corequisite(s): CM 2223.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 2211 Organic Chemistry Laboratory I

1 Credits This Laboratory course teaches students how to prepare, isolate and purify typical organic compounds. Experiments illustrate basic techniques. Lab fee required.

Pre/Co-requisite: CM 2213.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CM 2213 Organic Chemistry I

3 Credits This course covers chemistry of organic molecules: structure, nomenclature, properties and reactions of carbon compounds with emphasis on aliphatic compounds. It also introduces reaction mechanisms and stereochemistry.

Prerequisite(s): CM 1004 or CM 1024. Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 2221 Organic Chemistry Laboratory II

1 Credits This laboratory stresses complex preparation, purification, characterization and identification of organic compounds by chemical and physical means. It introduces instrumental methods of analysis and identification. Lab fee required.

Prerequisite(s): CM 2211; Pre/Co-requisite: CM 2223.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CM 2223 Organic Chemistry II

3 Credits This course continues CM 2213 and emphasizes finding the principles of organic chemistry in industrial practice and biochemical mechanisms. It introduces instrumental methods of analysis and identification.

Prerequisite(s): CM 2213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 2234 Industrial Organic Chemistry
This course demonstrates the basic ideas of organic chemistry, using industrial processes and important commercial materials. It covers the petroleum-based foundations of organic materials and shows how these petroleum-derived molecules ultimately lead, via important chemical reactions and intermediates, to the commercial products produced by the chemical industry. The course demonstrates how the principles of organic chemistry are intertwined with the many changes that characterize the chemical industry. The material is couched in a historical context.

Prerequisite(s): CM 1004 or equivalent.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 2614 Physical Chemistry I**

This course covers chemical thermodynamics with applications to solutions, phase and chemical equilibria. Molecular motion and transport properties are also covered.

Prerequisite(s): CM 1004 or CM 1024 and MA 1124 or MA 1154 and PH 1013.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 3114 Inorganic Chemistry**

This course covers atomic structures of elements as the basis for periodic classification. Also covered is descriptive chemistry of elements and their compounds and theories of chemical bonds. Coordination chemistry is introduced.

Prerequisite(s): CM 2614.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**CM 3314 Biochemistry I**

This course surveys modern biochemistry and emphasizes current areas of research. Also covered are structure-function relationships in proteins; enzymes and their mechanisms of action; bioenergetics principles and energy production; and biochemical theories and techniques.

Prerequisite(s): CM 2213 and CM 2614 or instructor’s permission.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 3324 Biochemistry II**

This course continues Biochemistry I. It covers principles of intermediary metabolism: energetic membrane structure and transport; structure and function of DNA and RNA; principles of molecular biology; the immune system; and hormonal regulation and cancer.

Prerequisite(s): CM 3314 or instructor’s permission.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 3514 Analytical Chemistry

4 Credits This course covers theories and applications of instrumentation techniques in modern analytical chemistry, including spectroscopy (UVVIS absorption, infrared absorption, fluorescence, Raman scattering, nuclear magnetic resonance), chromatography (gas, liquid) and other techniques (mass spectroscopy, electrophoresis). The accompanying laboratory part focuses on practical skills.

Prerequisite(s): CM 2614.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CM 3614 Physical Chemistry II

4 Credits This course covers chemical kinetics and molecular structures and interactions and their relationship to the bulk properties of matter. The laboratory component introduces the experimental quantitative methods of analytical and physical chemistry, including volumetric, calorimetric and optical techniques. Also covered are computer analysis of data and report writing.

Prerequisite(s): CM 2614.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 6 | Weekly Recitation Hours: 0

CM 4011 Information Sources for the Chemical Sciences

1 Credits This hands-on course introduces methods and tools for searching. It includes both electronic (CD-ROM and online) and print databases. Students may emphasize topics related to their research.

Note: Required of all BS students in biomolecular science.
Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 4314 Biomaterials

4 Credits This course covers natural macromolecules, including polypeptides, polysaccharides, lignin, biodegradable polymers and special characterizations of these biopolymers.

Prerequisite(s): CM 4414 or CM 4413.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 4413 Polymer Science

3 Credits This course provides a broad perspective of polymer science and its application in everyday life. The course has three major components: a survey of polymers, polymer synthesis and aspects of polymer physics.

Prerequisite(s): CM 2213 and CM 2614.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 4414 Polymer Chemistry

4 Credits This course introduces polymer chemistry. It covers the principles of various polymerization methods, characterization and physical chemistry of polymers. A laboratory is included.

Prerequisite(s): CM 2211, CM 2213 and CM 2614.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CM 4914 Undergraduate Research in Chemistry

4 Credits In this course, students conduct original investigations guided by staff members. Careful literature research is required before laboratory work starts. Continued reference to chemical literature is expected as well as active participation in conferences and seminars, both of which are scheduled as work progresses. A written report is required. Full-time students are expected to register for 8 credits of thesis during senior year. A research (lab) fee is required.

Prerequisite(s): CM 4011 and CM 5040.

CM 4924 Undergraduate Research in Chemistry

4 Credits In this course, students conduct original investigations guided by staff members. Careful literature research is required before laboratory work starts. Continued reference to chemical literature is expected as well as active participation in conferences and seminars, both of which are scheduled as work progresses. A written report is required. Full-time students are expected to register for 8 credits of thesis during senior year. A research (lab) fee is required.

Prerequisite(s): CM 4011 and CM 5040.

CM 5021 Information Sources for the Chemical Sciences

1.5 Credits This course is a hands-on introduction to methods and tools for searching and includes both electronic (CD-ROM and online) as well as print databases. Students may emphasize topics related to their research. Graduate students are required to take this course.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 5040 Chemical Laboratory Safety

0 Credits This course discusses problems of health and safety in chemical laboratories, including how to work safely with dangerous chemicals. This course must be completed by graduate and undergraduate chemistry students before they begin laboratory research.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 6013 Advanced Inorganic Chemistry

3 Credits This course covers theories of bonding in inorganic compounds. It introduces group theory as applied to molecular orbital and ligand field theories. Also covered are spectra of inorganic compounds and non-aqueous solvent. The transition to metal chemistry is introduced.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 6153 Special Topics in Inorganic Chemistry

3 Credits This course covers special topics in Inorganic Chemistry.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7033 Quantum Chemistry

3 Credits This course covers quantum structures of atoms and molecules. It covers fundamental ideas of quantum mechanics, applications to atomic and molecular structures and bonding, approximation methods and Interactions of light and matter.

Prerequisite(s): Undergraduate physical chemistry and physics or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7043 Statistical Thermodynamics and Kinetics

3 Credits This course covers statistical mechanics for chemical systems. Also covered are ensembles, partition functions, thermodynamic functions, applications to various systems, including non-ideal gas, gas of diatomic molecules, polymer, surface phenomena, chemical equilibria, biophysics and reaction kinetics.

Prerequisite(s): Undergraduate physical chemistry and physics or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7103 Biophysical Chemistry

3 Credits This course covers structure and properties of important biological macromolecules, including proteins, nucleic acids and polysaccharides; membranes and macromolecular complexes; applications of x-ray diffraction; NMR; vibrational and CD spectroscopy to the analysis of structure.

Prerequisite(s): CM 7043 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 7503 Special Topics in Physical Chemistry

3 Credits This course covers special topics in Physical Chemistry.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7723 Synthesis of Macromolecules

3 Credits This course covers organic aspects, including chemistry of monomer and polymer formation; modern mechanistic analyses of reactions; stereochemistry of polymer structures; forces of stereo regulation; condensation, free radical (bulk, suspension, emulsion, solution), ionic, ring-opening and non-classical polymerization reactions.

Prerequisite(s): Undergraduate organic chemistry or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7813 Characterization of Macromolecules

3 Credits This course covers characterization methods for linear-chain polymer and macromolecules in solution such as static and dynamic light scattering, osmometry, size exclusion chromatography, viscometry. Also covered are characterization methods for macromolecules in solid state such as crystallography and mechanical and thermal analysis.

Prerequisite(s): Undergraduate physical chemistry or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7853 Special Topics in Polymer Chemistry

3 Credits This course covers special topics in polymer chemistry.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 7923 Natural Polymers and Materials

3 Credits This course introduces natural and biomimetic polymers and is taught with an interdisciplinary view of biology, chemistry and macromolecular science. Topics covered include natural building blocks and methods by which nature carries out polymer synthesis and modification reactions; DNA; structural proteins; plant proteins; polysaccharides; polyesters; biosurfactants; polymers built from natural monomers and a wide variety of renewable resources; uses of these polymers as fibers, films, rheological modifiers, flocculants, foams, adhesives and membranes; special applications of natural polymers in medicine and as biodegradable plastics.
Prerequisite(s): Undergraduate physical chemistry or Adviser approval.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8023 Principles of Spectroscopy

3 Credits This course covers rotational, vibrational and electronic states of atoms and molecules. Also covered are the interaction of radiation with atoms and molecules; molecular symmetry; rotational and vibrational spectroscopy; and electronic spectroscopy.

Prerequisite(s): Undergraduate physical chemistry or adviser approval.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8073 Organic Spectroscopy

3 Credits This course covers structure elucidation by joint applications of spectroscopic techniques such as proton and carbon-13 magnetic resonance, infrared and mass spectroscopy and other methods.

Prerequisite(s): CM 9033 or Adviser’s approval.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8103 Liquid Chromatography

3 Credits This course covers the fundamentals of liquid chromatography. Also covered are partitioning; physical and chemical properties of packing materials; size exclusion chromatography; normal-phase and reversed-phase chromatography; hydrophilic interaction liquid chromatography; hydrophobic interaction chromatography; ion-exchange chromatography; preparative chromatography; gradient elution; and method development.

Prerequisite(s): Adviser’s approval.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8123 Mass Spectroscopy

3 Credits This course covers isotopes and molecular masses; various ionization methods and mass analyzers; application to biomolecules in sequential analysis of nucleic acids, peptides, proteins; and analysis of phospholipids, polysaccharides and fatty acids.

Prerequisite(s): Adviser’s approval.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8213 Bioanalytical Chemistry
3 Credits This course covers exciting new analytical methods in biochemistry and biotechnology, including atomic force microscopy, capillary electrophoresis, surface plasmon resonance and microarrays. The course is based directly on current scientific literature.

Prerequisite(s): CM 9413 or adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8303 Nuclear Magnetic Resonance Spectroscopy

3 Credits This course covers principles of NMR, including NMR spectrometers; spin decoupling; multi-pulse experiments; 2D NMR; and solid-state NMR.

Prerequisite(s): Adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8323 Microscopy

3 Credits This course review of optics, including optical-microscope fundamentals; phase contrast microscopy; confocal microscopy; R and Raman microscopy; transmission and scanning electron microscopy; and atomic force microscopy.

Prerequisite(s): Undergraduate physics or adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8503 Special Topics in Analytical Chemistry

3 Credits This course covers Special Topics in Analytical Chemistry.

Prerequisite(s): Adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8713 Guided Studies in Chemistry I

3 Credits This is a special project (experimental, theoretical, computational or literature search).

Prerequisite(s): Adviser’s approval.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 8723 Guided Studies in Chemistry I

3 Credits This is a special project (experimental, theoretical, computational or literature search).
**Prerequisite(s): Adviser’s approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 9033 Physical Organic Chemistry**

3 Credits This course covers molecular structure and bonding. Also covered are stereochemical and conformational principles; theories of bonding; physical parameters of stable and reactive molecular states; and applications in biochemistry and polymer chemistry.

**Prerequisite(s): Undergraduate organic chemistry or adviser’s approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 9043 Synthetic Organic Chemistry**

3 Credits This course covers reactivity of molecules. Also covered are methods of mechanistic study of reaction pathways and important reactions of organic and organometallic chemistry. The course introduces synthesis and applications in living systems and in polymer reactions.

**Prerequisite(s): Undergraduate organic chemistry or adviser’s approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 9053 Enzyme Catalysis in Organic Synthesis**

3 Credits This course provides students with a working knowledge of how to use biotransformations as a tool in organic chemistry. Students learn about general enzymatic reaction types that carry out the cleavage and formation of C-O bonds, P-O bonds, C-N bonds, C-C bonds, reduction reactions, oxidation reactions and isomerizations. In addition, students are taught about advanced principles currently being applied to the engineering of catalytic proteins.

**Prerequisite(s): Adviser’s approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 9403 Special Topics in Organic Chemistry**

3 Credits This course covers special Topics in Organic Chemistry

**Prerequisite(s): Adviser’s approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CM 9413 Biochemistry I**

3 Credits This course covers structure and function of biological macromolecules: proteins, nucleic acids, polysaccharides. Also covered are enzymatic kinetics, mechanism and control.
Prerequisite(s): Undergraduate biochemistry or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9423 Biochemistry II

3 Credits This course covers membrane structure and function and energy production, transformation and utilization. Also covered are the regulation of biochemical systems; the replication, transcription and translation of DNA; mutagenesis and carcinogenesis; and the Immune system.

Prerequisite(s): undergraduate biochemistry or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9433 Protein Engineering

3 Credits This course introduces modern protein engineering techniques available to researchers to understand protein structure and function and to create entirely new proteins for a variety of purposes. This is a new field that lies on the interface of chemistry, biology and engineering. The first part of the course discusses protein composition and structure and various genetic, biochemical and chemical techniques required to engineer proteins—all followed by specific topics. Topics include designing proteins that are highly structured and active at high temperatures and in non-aqueous solvents; that selectively interact with other proteins, small molecules and nucleic acids for therapeutic purposes; and that catalyze new reactions.

Prerequisite(s): CM 9413 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9443 Tissue Engineering

3 Credits This course teaches: (1) basic biological processes that occur during blood contact with artificial surfaces, (2) critical review of the literature in the field of tissue engineering, (3) biocompatibility issues relevant to a variety of implant devices that the student may encounter in future endeavors and (4) current approaches directed toward the engineering of cell-based replacements for various tissue types.

Prerequisite(s): undergraduate biochemistry or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9453 Special Topics in Biochemistry

3 Credits This course covers special topics in Biochemistry.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CM 9463 Recombinant DNA Technology

3 Credits  The course consists of lectures and demonstrations and covers practical aspects of recombinant DNA technology, including fundamental aspects of gene expression, restriction enzyme cleavage, plasmids, cloning, genetic transformation of bacteria, protein expression vectors, basic principles of protein purification and manipulation of cloned genes (site-directed mutagenesis).

Prerequisite(s): CM 9413 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9710 Chemical Colloquium

0 Credits

CM 9731 Seminar in Chemistry I

1.5 Credits  This course covers chemical topics of current interest and is presented by participating students, staff and outside speakers.

Note: One semester is required for MS chemistry students; three semesters required for PhD candidates.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9741 Seminar in Chemistry II

1.5 Credits  This course covers chemical topics of current interest and is presented by participating students, staff and outside speakers.

Note: One semester is required for MS chemistry students; three semesters required for PhD candidates.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CM 9751 Seminar in Chemistry III

1.5 Credits  This course covers chemical topics of current interest and is presented by participating students, staff and outside speakers.

Note: One semester is required for MS chemistry students; three semesters required for PhD candidates.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Civil Engineering
Civil Engineering

CE 875X Employer Focused Residency

*Up to 3 credits* Credits  In this course, students define a proposal for a project, the subject of which may be related to their employment. Students work one-on-one with an adviser throughout the semester. There is no formal classroom work; however, students must update their adviser weekly. The project runs no longer than one semester. Students formally present their projects’ findings to invited guests at the end of the semester.

*Prerequisite(s):* Admission to the Exec 21 Program or permission of a Construction Management Program Director.

CE 901X Readings in Civil Engineering

*Variable credit (1-3 credits)* Credits  This individual study of selected civil engineering literature is guided by a faculty adviser. Requirement: An acceptable written report or successful completion of an examination. Only one registration permitted, except with the permission of the department head.

*Prerequisite(s):* Instructor’s permission.

CE 997X MS Thesis in Civil & Urban Engineering Department

*6 Credits*  This course is an original investigation or design in the student’s principal field of study prepared and closely supervised by a faculty adviser. Candidates must successfully defend theses orally. Registration for a minimum of 6 credits is required.

*Prerequisite(s):* Degree status and thesis adviser’s approval.

CE 998X Dissertation Level Research

*Var 3-6 credits* Credits  This course involves an independent, original investigation that demonstrates creativity and scholarship worthy of publication in a recognized engineering journal. Registration for a minimum of 6 credits is required before registering for CE 999X. Registration for 3-6 credits per semester is permitted before the successful completion of the doctoral qualifying examinations.

*Prerequisite(s):* Degree status and approval of the dissertation adviser.
CE 999X PhD Dissertation in Civil & Urban Engineering

Var 0.5-12 Credits

This independent, original investigation must demonstrate creativity and scholarship worthy of publication in a recognized engineering journal. Candidates must successfully defend dissertations orally. Registration for a minimum of 15 credits is required before the defense. Registration must be continuous (excluding summer semesters), unless a formal leave of absence is requested and approved. Registration for 3 to 12 credits per semester is permitted. In the final semester, registration for 0.5 credits is permitted with department head approval.

Prerequisite(s): CE 9998, passing grade for RE 9990 PhD Qualifying Exam, graduate standing, and dissertation advisor approval

CE 1002 Introduction to Civil Engineering

2 Credits

This course introduces the student to the profession and practice of civil engineering. The course has four primary components: (1) a review of the principal sub disciplines of civil engineering and their relationship to urban and regional infrastructure; (2) a review of professional ethics and the responsibilities of engineers to their profession and to the general public, which includes a detailed study and discussion of the American Society of Civil Engineers (ASCE) and National Society of Professional Engineers (NSPE) codes of practice, and the use of case studies for illustration and discussion; (3) the use of AutoCAD as a tool for computer-based drawings, and the use of spreadsheets to develop analytic algorithms to solve simple engineering problems; and (4) an introduction to the use of GIS. The course includes a laboratory on the use of AutoCAD, as well as on GIS. Each laboratory is 6-7 weeks long.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

CE 1502 Leadership and Foundations of Construction Management

2 Credits

This course introduces the student to the profession of construction management. It focuses on the role of the construction manager and the fundamental concepts and terminology employed in planning, developing and constructing projects. Leadership, professional development, ethics and safety are emphasized.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 2113 Statics

3 Credits

This course covers: Vector treatment of static and dynamic equilibrium of particles and rigid bodies; equivalent forces and couple systems; distributed forces; static analysis of determinate trusses, frames and machines; friction; centroid and center of gravity, and moment of inertia.

Corequisite(s): PH 1013 or equivalent.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

CE 2123 Mechanics of Materials
Credits This course introduces basic principles of stress and strain in axial loading, shear, torsion and bending, along with principles of transformation of stress for design. Laboratory experiments provide hands-on experience.

Prerequisite(s): PH 1013 and CE 2113 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 2213 Fluid Mechanics and Hydraulics

Credits This course examines the basic principles of fluid mechanics with beginning applications to hydraulic design. Topics include fluid properties, fluid statics, elementary fluid dynamics and Bernoulli equation, continuity, energy and momentum equations and fluid kinematics. Additional topics are laminar and turbulent flow, boundary layer characteristics, drag and lift concepts (flow over immersed bodies), dimensional analysis and fluid measurements.

Prerequisite(s): CE 2113 or equivalent.
Weekly Lecture Hours: 2.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

CE 2323 Traffic Engineering I

Credits This course introduces the profession of traffic engineering and its components. The characteristics of road users, vehicles, highways and control devices and their impact on traffic operations are discussed. Quantification of traffic stream characteristics is treated in detail. The design and use of traffic control devices is covered, including a detailed treatment of traffic signal timing and design for both pre- timed and actuated signals. Coordination of signal systems on arterials and in networks is treated. A broad overview of highway traffic safety issues, policies, programs and mitigation measures are included.

Prerequisite(s): Sophomore status or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 2504 Construction Modeling and Data Structures I

Credits This course introduces architectural drafting and computer graphics. It capitalizes on state-of- the-art computer applications in managing construction. The course familiarizes the student with two-dimensional construction drawings that represent the current industry standard, and it propels the student towards the future by teaching the basics of three-dimensional (3-D) computer modeling. This course also introduces the use of the 3-D model with associated databases to manage construction.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 2513 Construction Materials and Methods

Credits This course covers the fundamental materials and methods used in constructing building and civil infrastructure projects. It also includes a laboratory that exposes students to commonly employed testing methods of construction materials.

Weekly Lecture Hours: 2.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0
CE 2523 Contracts and Construction Documents

3 Credits This course covers the documents used in design and construction, including design and construction agreements, drawings and specifications, general and special conditions and others used for procurement and construction administration. The course also examines the relationships among the owner, designers, contractors and suppliers. Students have the opportunity to discuss quality, safety and business and professional ethics.

Prerequisite(s): CE 1502 or CE 1002.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3122 Structural Dynamics

2 Credits This course covers: Three-dimensional treatment of the kinetics of particles and rigid bodies using various coordinate systems; Newton’s law, work, energy, impulse and momentum; and an introduction to dynamics of one, two and multi-degree of freedom systems, with and without damping.

Prerequisite(s): CE 2113 or equivalent. Corequisite(s): CE 3133 or equivalent.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3133 Structural Analysis

3 Credits This course offers in-depth coverage of structural analysis techniques. Topics: analysis of statically determinate structures; deflection calculations using energy methods; analysis of statically indeterminate structures using superposition; influence lines; and slope deflection, moment distribution and matrix analysis of structures. Computer applications are included.

Prerequisite(s): MA 2012 and CE 2123; or CE 2113 with a grade of B+ or better.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

CE 3143 Steel Design

3 Credits This course examines structural design principles and techniques. Topics: Design of steel tension members, beams and columns; design of beam-columns; and design of bolted and welded connections for steel design. The course includes a design laboratory in which students, working in groups, develop design projects.

Prerequisite(s): CE 3133 or equivalent.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 3153 Geotechnical Engineering

3 Credits This course covers: Introduction to soil mechanics and foundation engineering, including origin of soils; phase relationships; classification of soils; permeability; effective stress; seepage; consolidation; shear strength; slope stability; and bearing capacity.
CE 3163 Materials Engineering

3 Credits This course covers the mechanical behavior and durability of structural materials. Properties of steel, concrete, wood, asphalt and fiber composites are discussed. Material processing, optical metrology and stress analysis laboratories are conducted by students working independently and in groups on material preparation and evaluation topics.

Prerequisite(s): CE 2123 or equivalent.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 3223 Environmental Engineering I

3 Credits This course introduces water and wastewater treatment. Topics: Stream assimilation and public health; introduction to air pollution and solid waste management; and laboratory analysis of water and wastewater samples and treatment process tests.

Prerequisite(s): CE 2213 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 3243 Water Resources Engineering I

3 Credits This course provides a detailed overview of water resources engineering, including both analysis and design elements. Topics covered: open-channel flow; pipe networks; reservoir balances; hydrologic techniques; surface water and ground-water supplies; water demand; and development of water resources for multiple purposes.

Prerequisite(s): CE 2213 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3313 Introduction to Transportation Systems

3 Credits This course focuses on the fundamental conceptual elements of transportation systems and describes the approaches used to analyze and design transportation systems. The course covers the basic material about transportation systems, the context within which they operate and a characterization of their behavior.

Prerequisite(s): Junior status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3343 Design of Traffic Facilities

3 Credits This course introduces the design of traffic facilities with emphasis on highway design. Students will be introduced to the basic design concepts of horizontal and vertical alignment, super elevation and cross-section design. The course also covers
fundamentals of intersection and interchange design, pavement design, design of parking facilities, as well as bikeway and walkway design. Lectures are supplemented by a design laboratory.

Prerequisite(s): CE 2323, or equivalent, or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

CE 3353 A History of the NYC Transit System

3 Credits This course traces the technological history of public transportation in New York City and investigates its role in the development of the city, its economy and its social fabric. From the early days of horse-drawn public carriages to the modern subway system, the role of the public transit in the historical development patterns of New York City is treated. The course covers trolley systems, the age of the elevated railways and the subway system. Political, social and economic issues involved in the development of these critical infrastructures are discussed. Students develop independent project reports on aspects of the NYC public transit system, or on public transit systems in other major world cities.

Prerequisite(s): Junior status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3503 Cost Estimating

3 Credits Students learn the classification of work, quantity surveying techniques and basic estimating principles applied to construction projects. Also addressed are contracts; specifications and other construction documents; and the identification and allocation of direct and indirect project costs, overhead and profit. Students are introduced to computer-based estimating techniques and software.

Prerequisite(s): CE 1502 or CE 1002.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3513 Construction Scheduling

3 Credits Students learn to apply the Critical Path Method (CPM) to construction projects, using precedence diagram networks. The course covers sequencing, cost allocation, updating, cash flow, resource constraints and scheduling, manpower leveling and distribution, time-scale networks, lead and lag-time constraints, time-cost tradeoffs, overlap and other specific leading edge scheduling techniques. Students direct an entire project from planning through scheduling and control, both manually and through software.

Prerequisite(s): CE 1502 or CE 1002.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 3532 Construction Site Layout

2 Credits This course studies the practical applications of surveying and its relationship to site planning and design. The first portion of the course concentrates on land surveying concepts, including mathematics, horizontal and vertical control and angle measurement. The second portion of the course applies surveying data to site layout using traverses, area computations, property
surveys, topography, and construction surveys for highway and building applications.

Prerequisite(s): CE 1502 or CE 1002.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3541 Surveying

1 Credits This field laboratory introduces students to basic surveying practice, including the use of surveying equipment (wheels, tapes, levels and theodolites), measurement theory and computation, data accuracy and precision, and the field book to properly record data.

Prerequisite(s): CE 1502 or CE 1002.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 3553 Non-Structural Building Systems

3 Credits This course introduces the students to mechanical, electrical and vertical transportation systems for buildings. It examines fundamental aspects of the design, procurement and construction of heating, ventilating and air conditioning (HVAC), supply and sanitary plumbing, fire detection and suppression, high- and low-voltage electrical, security, elevator and escalator and building management systems.

Prerequisite(s): CE 1502 or CE 1002.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 3563 Construction Modeling and Data Structures II

3 Credits This course is the continuation of the student’s exploration of construction management through building information modeling (BIM). The students will apply their understanding of construction assemblies, trade scheduling and estimating through studies of a larger project. Emphasis will be placed on the student's ability to model complex assemblies while coordinating and scheduling multiple trades. This progressive approach incorporates the 3D model and the associated databases in the management of construction by developing unit pricing, detailed scheduling and procurement attributes associated with a design.

Prerequisite(s): CE 2504.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 4033 Introduction to Urban Infrastructure Systems Management

3 Credits This course provides students with an overview of key issues involved in the planning, management, operations and maintenance of urban infrastructure systems, including transportation, water supply, power, communications and information systems. It includes elements of engineering and technology, management, economics, finance, regulatory and public policy that have an impact on the sustainable development of the urban environment. The course features several distinguished guest lecturers from infrastructure industries and public agencies who share significant case studies with students. The course includes a component on GIS, with a focus on how to collect, integrate and share spatial data in urban infrastructure management. Group projects are required.
CE 4043 Sustainable Cities

3 Credits The course provides an overview of issues that need to be addressed to make a city sustainable, beginning with a definition of what is intended by the concept of sustainability and a discussion of what is the essence of a city. Students are asked to become familiar with the major challenges in making a city sustainable, and to provide, as part of their homework, a paper addressing a topic covered by the course through research and, where necessary, proposed solutions.

CE 4053 Biosoma – Environmental Design of the City of the Future

3 Credits The goal of this course is to improve the engineering design of a city and its components. The course focuses on the city as an entity that concentrates living organisms, societal organizations and activities and machines, interacting with the environment both outside and inside the city. A number of essential questions about the future of cities will be examined, such as: (1) what does urbanization mean for the future of humankind in terms of resources, capabilities, ideologies and culture? (2) How can the design of cities affect their future? (3) What should be the role of the engineer? (4) How can the engineer of the future be prepared for that role? (5) What critical engineering interventions are needed to influence the future of today’s cities? Each student will select a project that deals with some aspects of the course and present its results to the class.

CE 4092 Leadership, Business Principles, Policy and Ethics in Civil Engineering

2 Credits This course is in seminar form and is required of all senior students in Civil Engineering. It focuses on various aspect of professional practice in civil engineering, and it augments and enriches the student’s educational experience, including the capstone design course. Topics include professional roles and responsibilities, professional registration and its importance, continuing education, engineering ethics, procurement of work, competitive bidding, quality-based selection processes and construction management. Students are also introduced to the design and construction processes used by federal, state and local agencies, as well as private owners. The course includes a no-credit recitation that prepares students for the Fundamentals of Engineering (FE) examination, which Civil Engineering students must take before graduation.

Prerequisite(s): Senior status or permission of instructor.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 3

CE 4173 Foundation Engineering

3 Credits This course introduces the development of foundation engineering, including: site exploration; soil sampling; interpretation of boring logs; bearing capacity of footings; settlement of structures; lateral earth pressure; design of retaining walls, braced excavations and sheet pile walls; and design of deep foundations.
Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 4183 Reinforced Concrete Design

3 Credits This course offers a detailed treatment of reinforced concrete design: Material properties, American Concrete Institute (ACI) load factors and design strength; shear and diagonal tension in beams; reinforced concrete columns; two way slabs; footings; shear walls; and torsion.

Prerequisite(s): CE 3133 or equivalent.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 4193 Timber and Masonry Structures

3 Credits This course covers: Properties and classification of structural lumber; design of timber connectors; design and construction of residential and industrial timber buildings; beams, frames, columns and trusses of sawn lumber and glued laminated construction; manufacture and properties of concrete masonry units; properties of mortar and grout; and design and construction of load-bearing, reinforced and unreinforced masonry structural elements.

Prerequisite(s): CE 3143 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4253 Hydraulic Systems

3 Credits The application of basic principles of fluid mechanics and water resources in hydraulic engineering and design. Topics covered include: laminar and turbulent flow; boundary layer characteristics; subcritical and super critical flow; applications to pipe and open channel flow; pipe networks; hydraulic machinery and structures; river and canal systems and flood plains; safety; and reliability issues.

Prerequisite(s): CE 3243 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4263 Environmental Geotechnology

3 Credits This course benefits students who are entering the consulting industry. It is difficult to separate environmental and geotechnical concerns in the urban environment. This course teaches students what environmental concerns to expect when planning construction projects, investigating sites and overseeing construction. The course covers methods for addressing these concerns. Topics covered include clay mineralogy, soil/water/contaminant interactions, interfacial tension and capillarity and remediation techniques.

Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0
CE 4273 Environmental Engineering II

3 Credits This course offers detailed coverage of water and wastewater treatment unit operations and includes a laboratory on processes and process design. Experiments are performed to evaluate laboratory-scale conventional water and waste treatment processes. Lectures cover detailed theory, design and advanced concepts.

Prerequisite(s): CE 2213 and CE 2323 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4333 Traffic Engineering II

3 Credits This is a second semester traffic engineering course for undergraduate students. It focuses on highway capacity and level of service analysis on uninterrupted and interrupted flow facilities. Additional analysis of signalized and unsignalized intersections is included using current computer software packages. Facility types include freeways, freeway weaving areas and ramp junctions, rural and suburban multilane highways, two-lane rural highways, suburban and urban arterials and intersections.

Prerequisite(s): CE 2323 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4503 Construction Engineering

3 Credits This course covers engineering fundamentals and developing trends in the use of excavating and earth-moving equipment, trucks, pumps, drilling and blasting equipment and cranes. Also considered are shoring and bracing and other temporary site construction operations.

Prerequisite(s): CE 1502 or CE 1002, and junior standing.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4513 Construction Project Administration

3 Credits This course examines the roles of the project participants in executing a construction project, focusing on delegating administrative duties and responsibilities and managing and coordinating the physical work and administrative control of project information and records. Students use computer-based project administration techniques and software.

Prerequisite(s): CE 1502 or CE 1002, and junior standing.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4523 Structural Building Systems

3 Credits This course introduces the general principles of loads on buildings and the design and analysis of conventional structural building systems in steel, concrete, wood and masonry. It also addresses the construction of such systems.

Prerequisite(s): CN major, CE 2123 and junior standing.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 4533 Construction Law

3 Credits The course introduces students to areas of the law that they are likely to encounter in construction. Following an introduction to the legal system and form of legal analysis, areas addressed include contracts, procurement, scope definition, delays and acceleration, site conditions, warranties, termination, tort claims, dispute resolution and ethics.

Prerequisite(s): Junior standing.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4543 Construction Management Project

3 Credits This course is the senior capstone experience in construction management which requires students to demonstrate the skills acquired through the undergraduate construction management curriculum. Students work individually or in groups as determined by the instructor and other participating industry advisers. Students attend regularly scheduled lectures and workshops, participate in interim and final presentations, and are responsible for periodic written submissions.

Prerequisite(s): Senior status or as otherwise determined by the Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4613 Selected Topics in Structural and Geotechnical Engineering

3 Credits This course discusses unique topics of current interest in structural and geotechnical engineering. The course may feature a detailed look at a single topic or a series of focused topical presentations.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4623 Selected Topics in Environmental and Water Resources Engineering

3 Credits This course examines unique topics of current interest in environmental and water resources engineering. The course may feature a detailed look at a single topic or a series of focused topical presentations.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4633 Selected Topics in Transportation Engineering

3 Credits This course explores unique topics of current interest in transportation engineering. The course may feature a detailed look at a single topic or a series of focused topical presentations.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 4643 Selected Topics in Construction Management

3 Credits This course covers unique topics of current interest in construction management. The course may feature a detailed look at a single topic or a series of focused topical presentations.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 4710 Readings in Civil Engineering

variable credit (1-4) Credits These readings in subjects related to the civil engineering curriculum are individually guided. Topics arise from a regular course and must extend and transcend material covered in the traditional curriculum. Students need prior approval of the instructor with whom he or she is to work and a topic approved by that instructor before registering for a readings course. Such courses require a written report on the subject of the student’s readings before a grade is given.

Note: A student may take this course more than once.

CE 4814 Civil Engineering Design

4 Credits This is the senior Capstone design experience in civil engineering. A project (or projects) involving integration of the civil engineering sub-disciplines is described and presented. Working groups are established. All groups may work on a single project or several may be prescribed, depending upon the semester. Lectures cover project details and present specific design applications that may not have been included in other courses. Each group must submit a full design report and present it orally.

Prerequisite(s): CE 3143 and CE 3153 or equivalents. Corequisite(s): CE 3223 and CE 3243 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CE 5983 Selected Topics in Civil Engineering I

3 Credits Special topics in current areas of civil engineering that cover more than one sub-disciplinary category are examined. Open to undergraduate students with exceptional records upon approval of the undergraduate adviser.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 5993 Selected Topics in Civil Engineering II

3 Credits Special topics in current areas of civil engineering that cover more than one sub-disciplinary category are examined. Open to undergraduate students with exceptional records upon approval of the undergraduate adviser.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 6013 Theory of Structural Analysis and Design

3 Credits This course discusses theories of structural analysis and their relationship to design. Topics: Classical structural mechanics, matrix procedures and numerical methods in problem-solving; and analysis of statically indeterminate beams, frames and trusses using force and displacement methods. Also considered are elastic supports, movement of supports and temperature effects.

Prerequisite(s): CE 3133 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6023 Materials for Civil Engineers

3 Credits This course covers: Materials composition and production of cementitious materials; polymeric composites and metals; mechanical properties subject to short-term and long term loads, impact and fire; fatigue and fracture; transport properties, chemical degradation and long-term durability.

Prerequisite(s): Graduate Status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6033 Selected Topics in Structural Analysis I

3 Credits This course discusses special current interest topics. It is offered at irregular intervals by advance announcement. Graduate advisers may approve repeat registration for different topics.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6043 Selected Topics in Structural Analysis I

3 Credits This course discusses special current interest topics. It is offered at irregular intervals by advance announcement. Graduate advisers may approve repeat registration for different topics.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6063 Bridge Engineering

3 Credits This course covers types of bridges; geometric design of bridges; construction materials and techniques; simplified bridge analysis; special problems in the design of steel and reinforced- concrete bridges; bridge inspection policies; bridge rehabilitation procedures; bridge management systems; and the effects of wind and earthquakes on long-span bridges.

Prerequisite(s): Undergraduate structural analysis and steel design.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 6073 Instrumentation, Monitoring and Condition Assessment of Civil Infrastructure

3 Credits This course covers: A systematic approach to planning and executing instrumentation, monitoring and condition assessment programs; strain measurements; civil engineering sensors (static, dynamic, optical); environmental measurements; mechatronic sensors; signal conditioning, information measurements and error analysis; business aspects; advanced-measurement systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6133 Stability of Structures

3 Credits This course addresses the stability of structural systems. Topics: Investigation of buckling of structural configurations composed of beams, plates, rings and shells; effects of initial geometric imperfections, load eccentricities and inelastic behavior; and the application of energy measures and numerical techniques.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6143 Steel Structures

3 Credits This course explores compression members; elastic and inelastic buckling of columns and plates; lateral support of beams; torsion of open and closed sections; warping; lateral torsional buckling of beams; and bi-axial bending. Other topics include: Plate girders, including stability of webs and flanges; combined bending and axial load; instability analysis; and design of rigid and semi-rigid mechanisms of continuous beams and rigid frames. Both elastic and plastic design criteria are discussed.

Prerequisite(s): CE 3143 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6163 Finite Element Methods

3 Credits Students study the basic theory of the finite element method and learn how to apply it using widely used engineering programs. The course emphasizes developing finite element models and executing the analysis. Students learn to recognize modeling errors and inconsistencies that could lead to either inaccurate or invalid results.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6183 Concrete Structures

3 Credits This course covers design principles and construction methods for reinforced and pre-stressed concrete structural elements; response of members subject to axial loading, shear and flexure; design of columns, deep beams and shear walls; design and detailing for connection regions; design of pre-tensioned and post-tensioned beams and slabs; and the effect of short-
term and long-term deformations.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6193 Wind and Earthquake Engineering

3 Credits This course examines characteristics of wind and earthquake loads; atmospheric motions and boundary layer theory; response of structures to wind forces; code treatments of wind loads on structures; calculation of lateral forces from seismic events; lateral force-resisting systems; diaphragms and center of rigidity; response spectrum and time-history; ductility; concrete and steel frame structures; braced frames; shear walls; dual systems; story drift; detailing requirements.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 6253 Structural Dynamics

3 Credits This course covers: Dynamic response of single degree of freedom systems; theory of vibration of finite degree of freedom systems; influence coefficient method; analytical and numerical solutions to dynamic response problems; and nonlinear analysis of single degree of freedom systems. Emphasis also on computer analysis of large complex systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7223 Hydrology

3 Credits This course covers: Hydraulic cycle; meteorological considerations; analysis of precipitation, runoff, unit hydrographs, flood routing and reservoir storage; principles of groundwater hydrology; and an introduction to frequency analysis of floods and droughts.

Prerequisite(s): Adviser’s approval and MA 1124 and CE 2213 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7233 Groundwater Hydrology and Pollution

3 Credits This course looks at the characteristics of confined and unconfined flow of water through porous media; groundwater and well hydraulics; quality of groundwater; environmental influences; groundwater pollution; management aspects of groundwater and groundwater modeling.

Prerequisite(s): CE 2213 or equivalent, or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7353 Selected Topics in Water Resources and Hydraulic Engineering I
This course examines topics of current interest in water resources and hydraulic engineering. Topics vary with each offering and are disseminated before the semester of offering.

Prerequisite(s): Instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7363 Selected Topics in Water Resources and Hydraulic Engineering II**

This course examines topics of current interest in water resources and hydraulic engineering. Topics vary with each offering and are disseminated before the semester of offering.

Prerequisite(s): Instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7373 Environmental Chemistry and Microbiology**

This course introduces the chemistry and microbiology of polluted and natural waters, including applications of principles developed.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

**CE 7393 Advanced Environmental Chemistry and Microbiology**

This course explores advanced topics in chemistry and microbiology of polluted and natural wastewater treatment.

Prerequisite(s): CE 7373 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7423 Water and Wastewater Treatment**

This course covers the physical, chemical and biological principles of process design and treatment of water and wastewater. Topics include aeration, filtration, softening, chemical treatment, coagulation, occlusion, desalination, and taste and odor control.

Corequisite(s): CE 7373.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7433 Advanced Water and Wastewater Treatment**

This course covers further the processes discussed in CE 7423. Topics include sedimentation, adsorption, aerobic and anaerobic biological treatment, sludge treatment and disposal.
Prerequisite(s): CE 7423. Corequisite(s): CE 7393.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7453 Water and Wastewater Treatment Laboratory**

*3 Credits* This laboratory course covers processes in water and wastewater engineering, dealing with physical, chemical and biological methods and principles. Processes include disinfection, softening, sedimentation, oxygen transfer, coagulation, adsorption, filtration and aerobic and anaerobic biological treatment systems and Warburg analysis of waste.

Corequisite(s): CE 7433.
Weekly Lecture Hours: 1 | Weekly Lab Hours: 2 | Weekly Recitation Hours: 0

**CE 7463 Industrial Waste Treatment**

*3 Credits* This course explores sources of industrial wastewaters and their treatability by physical, chemical and biological processes. Topics: Problems and solutions involved in combining municipal and industrial waste treatment; and status of government regulations imposed on industries in prevention of water pollution.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7473 Analysis of Stream and Estuary Pollution**

*3 Credits* This course covers dispersal and decay of contaminants introduced into lakes, streams, estuaries and oceans, and the effects of pollutants on chemical quality and ecology of receiving waters.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7513 Environmental Health Engineering**

*3 Credits* This course covers theory, methodology and instrumentation associated with environmental health. Topics include epidemiology, food vectors, radiation, pest control, heating, ventilation, noise, illumination, hazards of home and community environment and other subjects affecting public health.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 7523 Air Pollution**

*3 Credits* This course discussed the causes and effects of air pollution, methods of sampling, interpretation of data, meteorological aspects and methods of air-pollution control.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 7533 Hazardous/Toxic Waste Management

3 Credits This course looks at methods in the management of hazardous/toxic waste sites. Topics covered include health and safety, legal aspects, contamination of the environment, treatment processes and toxicology and risk assessment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7543 Site Remediation

3 Credits This course covers: treatment and disposal technologies for hazardous waste site remediation; in-situ and ex-situ processes; physicochemical processes, stabilization and solidification; biological processes, including aerobic and anaerobic systems for degradation and detoxification; thermal processes and incineration; and storage, land disposal and containment. Remediation planning and technology selection for hazardous waste containment and clean up for typical case studies are examined. The study of decision-making and technology selection is a key course component.

Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7553 Environmental Toxicology

3 Credits This course stresses basic concepts essential to understanding the action of exogenous chemical agents on biological systems. The course covers principles of absorption and the effects of chemical agents on metabolism. The pathways of metabolism of these compounds and the principles of elimination from biological systems are discussed. The course includes discussion of toxicokinetics, types of toxic responses and the current experimental methods of toxicity.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7563 Environmental Law

3 Credits This course presents legal principles and issues relating to environmental law. Historical perspectives and case laws will be considered. Topics include the Clean Water Act, nonpoint sources and water quality laws, the Clean Air Act and its amendments, the National Ambient Air Quality Standards and the National Environmental Policy Act. The above legislation and its impact on policy and technology also will be considered.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7583 Air Pollution Engineering Control

3 Credits Topics include: Pollutant emissions control; analysis of pollutant properties, concentrations and boundary conditions; absorptive and reactive recovery processes for moving and stationary sources; and formation and removal of gaseous oxides (NO, SO, CO, etc.) and of aerosols and other particulates.
Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7673 Environmental Impact Assessment

3 Credits This course examines legal and technical requirements in preparing environmental impact statements. Considerations include legal and technical requirements, the procedure and the interdisciplinary nature of the analysis. Topics include overall impact evaluation, categories of impacts, problem definition, quantification of impact, methods used in analysis, field evaluations, mitigations, hearing procedures and management. Practical examples and case studies are used.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7703 Solid Waste Management

3 Credits This course covers engineering aspects of solid waste collection, transport and disposal, including incineration, sanitary landfill, composting, recovery and reutilization. Also covered is the economic evaluation of factors affecting selection of disposal methods.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7713 Selected Topics in Environmental and Water Resources Eng I

3 Credits This course explores nitrification in natural and treated waters, hazardous and toxic wastes, organic removal from water supplies, water reuse, specialized aspects of biological wastewater treatment, environmental health, solids disposal, modeling natural waters and treatment systems, hydro-economic models, finite-difference and finite-element models, synthetic hydrology and desalinized and recycled-water systems.

Prerequisite(s): Instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7723 Selected Topics in Environmental and Water Resources Eng II

3 Credits This course explores nitrification in natural and treated waters, hazardous and toxic wastes, organic removal from water supplies, water reuse, specialized aspects of biological wastewater treatment, environmental health, solids disposal, modeling natural waters and treatment systems, hydro-economic models, finite-difference and finite-element models, synthetic hydrology and desalinized and recycled-water systems.

Prerequisite(s): Instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7753 Environmental Systems Management
Credits  This course provides an overview of information technologies as applied to the remote sensing of environmental infrastructure systems, and includes the development of infrastructure system databases to assist complex decision-making on environmental infrastructures.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7813 Infrastructure Planning, Engineering and Economics

Credits  This course covers methods for identifying, formulating, preliminarily appraising and analyzing in detail individual projects and systems of civil engineering projects. Different approaches relevant to government agencies, public utilities, industrial firms and private entrepreneurs are discussed, as well as planning of projects to satisfy single and multiple purposes and objectives, meet local and regional needs and take advantage of opportunities for development. Also covered are financial and economic analyses, including sensitivity and risk analysis; mathematical models for evaluation of alternatives and optimization; and environmental, social, regional economic growth, legal and institutional and public involvement impacts of projects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7823 Forensic Engineering

Credits  This course emphasizes lessons learned by analyzing structural failures and studying the work of outstanding practicing professional engineers. Also covered is the application of engineering principles for proper performance of civil engineering structures.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7833 Infrastructure Rehabilitation: A Practical Approach

Credits  Upgrading the nation’s aging infrastructure is a national priority well into the 21st century. In this course, a preeminent civil engineer who has overseen major rehabilitation projects focuses on the direct practical application of engineering principles required to address today’s infrastructure rehabilitation needs. The course emphasizes conceptual thinking, brainstorming techniques, team evaluation of alternative solutions, oral and written communication and intensive classroom participation.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7843 Introduction to Urban Systems Engineering

Credits  This course provides a descriptive overview of key infrastructure systems and technologies that must be managed, operated and maintained. Systems treated include buildings and structures, water supply, solid and liquid waste handling and disposal, transportation, power, communications and information systems, health and hospitals, police and protection. The course explores the financial, political, administrative, legal and institutional settings of these systems and technologies. A portion of the course features distinguished guest lecturers who are experts in some of the systems and technologies included.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 7853 Concepts and Implementation of Infrastructure Management Systems

3 Credits This course reviews state-of-the-art, performance-monitoring and system-condition assessment methodologies as part of infrastructure management systems. Emphasis is on information technologies as applied to remote sensing and database development for urban systems management. Tools, such as GIS and dedicated databases for condition assessment are presented in a laboratory environment. Invited experts participate in such areas as transportation, water distribution and utilities.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7863 Infrastructure Monitoring and Performance Assessment

3 Credits This course introduces the physical nature of infrastructure materials and systems. The concept of performance is introduced from the viewpoint of strength and durability. Lectures and laboratory demonstrations identify the mechanisms of degradation and cover techniques for condition assessment and quality assurance.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7983 Selected Topics in Construction I

3 Credits This course covers topics of special interest in current areas of construction management. Topics are announced before each semester’s offering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7983 Special Topics in Infrastructure Systems and Construction I

3 Credits This course discussed contemporary topics of interest, such as methodologies and procedures for analysis of existing infrastructure systems, geographic information, data and management systems, photogrammetric and remote sensing techniques and use and design of infrastructure facilities and systems. Other topics include, but are not limited to, intelligent buildings and other modern constructed works, temporary structures for construction and problems in construction engineering, new approaches in construction management and integration and automation of construction processes.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 7993 Selected Topics in Construction II

3 Credits This course covers topics of special interest in current areas of construction management. Topics are announced before each semester’s offering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 7993 Special Topics in Infrastructure Systems and Construction II

3 Credits This course discussed contemporary topics of interest, such as methodologies and procedures for analysis of existing infrastructure systems, geographic information, data and management systems, photogrammetric and remote sensing techniques and use and design of infrastructure facilities and systems. Other topics include, but are not limited to, intelligent buildings and other modern constructed works, temporary structures for construction and problems in construction engineering, new approaches in construction management and integration and automation of construction processes.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8203 Project Management

3 Credits This course covers management of technology-based projects ranging—from individual research and development to large-scale and complex technological systems. Topics covered include: feasibility and risk analyses; project selection and portfolio optimization; functional and administrative structures; coordination and scheduling of activities; personnel planning; negotiations and contracts; cost estimation; capital budgeting; cost controls; and effective matrix management.

Also listed under: Also listed under MG 8203.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8243 Construction Modeling Techniques

3 Credits This course deals with various construction-modeling techniques, including the development of two-dimensional (2D) and three-dimensional (3D) design documents. Students are introduced to the development of building information models (BIM) and their associated databases, using state-of-the-art design and management systems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8253 Project Management for Construction

3 Credits This course covers topics specific to developing and coordinating large projects, including organizational structures, management functions, pricing and estimating project costs, bidding and contracting, risk allocation, scheduling, time and cost control, labor relations, quality management and project life-cycle activities.

Also listed under: MG 8253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8263 Construction Cost Estimating

3 Credits This course covers estimating and cost control from the viewpoint of contractors and construction engineers; details of estimating with emphasis on labor, materials, equipment and overhead.

Also listed under: MG 8263.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CE 8273 Contracts and Specifications

3 Credits This course covers principles of contract law as applied to the construction industry and legal problems in preparing and administering construction contracts.

Also listed under: MG 8273.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8283 Risk Analysis

3 Credits This course investigates the ever-rising importance of risk analysis in project management. Topics: Analysis of qualitative and quantitative risk; techniques in probability analysis, sensitivity analysis, simulation of risk and utility theory; and computational methods for calculating risk. Students are exposed to the complexity of real-world corporate and public problems through case investigations.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8293 Construction Operations Analysis

3 Credits This course examines the evaluation and model development of productivity, safety, quality and materials handling in construction operations. Topics include the principal methods for analysis and pre-planning work activities, including the use of three-dimensional (3D) building information models (BIM), four-dimensional (4D) and fully integrated and automated project processes (FIAPP), logistics animation, Monte Carlo scheduling, stochastic simulation and queuing theory. Students are introduced to the use of financial models for task, activity, project and program analyses.

Prerequisite(s): CE 8243 or Construction Management Program Director’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8303 Information Systems in Project Management

3 Credits The course examines the use of contemporary tools for managing the vast array of information over the life of a project. Information handling is reviewed from the perspectives of knowledge acquisition and presentation. The course focuses on applying three-dimensional (3D) building information models (BIM) and four-dimensional (4D) and fully integrated and automated-project processes (FIAPP) that integrate 3D computer models, simulation, cost estimating, scheduling, procurement and information technology (with emphasis on the implementation of 3D computer models and relational databases as information systems for project information handling and project automation).

Prerequisite(s): CE 8243 or Construction Management Program Director’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8313 Engineering for Construction I: Methods and Technologies
This course covers planning, design and equipment for new construction and for infrastructure rehabilitation; engineering fundamentals of earth moving; soil stabilization and compaction; methods for tunneling through rock and earth and rock blasting; foundation grouting; piles and pile driving equipment; dewatering systems and pumping equipment; factors affecting the selection of construction equipment; review of conventional construction equipment; and trends in robotics.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8323 Engineering for Construction II: Design**

This course covers planning, design and equipment for new construction and for infrastructure rehabilitation; engineering fundamentals of earth moving; soil stabilization and compaction; methods for tunneling through rock and earth and rock blasting; foundation grouting; piles and pile driving equipment; dewatering systems and pumping equipment; factors affecting the selection of construction equipment; review of conventional construction equipment; and trends in robotics.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8333 Marketing for Construction Management and Engineering Services**

This course focuses on the process of procurement of construction management and engineering services. It incorporates a hands-on approach to current industry practices. The materials address the following: identifying leads; researching and evaluating competition through various sources; reviewing and critiquing requests for qualifications (RFQ) and requests for proposals (RFP) and responses; developing a marketing resume; developing project profiles; evaluating presentations; and selecting successful candidates. Students will prepare their own proposals and presentations.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8343 Construction Site Safety**

This course is for individuals who are interested in construction safety and the realities of a construction project and for those seeking certification as a Site Safety Manager from the New York City (NYC) Department of Buildings (DOB). Students learn about the comprehensive Subchapter 19 of the New York City Building Code and the City's Rules and Regulations on construction site safety projects. The course curriculum includes the content approved by the NYC DOB to prepare students for the Site Safety Manager examination.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8353 Construction Scheduling**

Students will be instructed in advanced Critical Path Method (CPM) construction scheduling techniques including the use of Primavera Project Planner v. 7.0. The course will cover Precedence Diagramming Method (PDM), project resources and resource leveling, schedule updating, schedule impacts of date constraints, project time and cost trade-offs, activity duration estimating, work breakdown structures, differing scheduling requirements on different types of construction projects and an overview of construction contract scheduling specifications. An introduction to other scheduling methodologies and the use of schedules in construction claims will also be addressed.
CE 8363 Building Information Modeling Project Controls

3 Credits The purpose of this course is to enable students to use Building Information Modeling (BIM) as part of the planning and measurement of performance on construction projects. Students will learn various earned value management techniques to measure the actual performance of work and the associated cost and schedule impacts as compared to baseline values. Emphasis will also be placed on the importance of managing and tracking changes, and mitigating their impacts on construction projects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8373 Construction Accounting and Finance

3 Credits This course introduces students to the uses of accounting and financial analysis in decision making in a construction and development environment. The course will demonstrate to students how the principles of accounting and financial management can be adapted for, and used in the management of construction companies and project management. Students will review accounting concepts, rules, regulations and reporting requirements as they apply to construction and development, and they will use and create accounting and financial models.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8403 Geotechnics and Geomaterials

3 Credits This course examines index properties of soil, mechanical behavior, shear strength, stress-strain characteristics, drained and undrained soil behavior, permeability, seepage, groundwater flow and control and consolidation of soils.

Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8423 Ground Improvement

3 Credits This course discusses foundation engineering practice, foundation rehabilitation and emerging ground-improvement technologies. Topics covered are the selection, design and analysis of ground-improvement techniques for different foundation problems, as well as the construction, monitoring and performance evaluation of such solutions.

Prerequisite(s): CE 3153 and CE 4173 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8433 Urban Geotechnology
3 Credits This course looks at case histories on geotechnical design, construction and rehabilitation in the urban environment. Topics covered: Special construction problems and innovative solutions; unforeseen ground conditions performance monitoring; remedial planning and implementation; and geotechnical design and construction issues from a practicing engineer’s perspective.

Prerequisite(s): CE 3153 and CE 4173 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8493 Environmental Geotechnology

3 Credits This course covers: Clay mineralogy; soil water interaction processes; chemical transport through soils; hydraulic conductivity, diffusion and attenuation mechanisms; water-disposal systems; design of landfills, seepage barriers and cut-off walls; geo-environmental site characterization techniques; and soil remediation techniques.

Prerequisite(s): CE 3153 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8603 Selected Topics in Geotechnical Engineering

3 Credits This course explores current special interest topics, such as ground improvement, geotechnical earthquake engineering, site characterization and remediation. Topics vary with each offering and are disseminated before registration.

Prerequisite(s): CE 4173 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8663 Advanced Foundation Design

3 Credits Topics covered: Advanced analysis of foundations, shallow foundations, bearing capacity, settlement, deep foundations, axial and lateral loading of piles, wave equation analysis, drilled piers, design and construction issues and case histories.

Prerequisite(s): CE 3143 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8673 Excavation Support Systems

3 Credits This course covers advanced analysis of foundations, shallow foundations, bearing capacity, settlement, deep foundations, axial and lateral loading of piles, wave-equation analysis, drilled piers and design and construction issues.

Prerequisite(s): CE 3153 and CE 4173 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 8703 Managing and Leading in the 21st Century
Today's mega projects require the formation of large multidisciplinary teams including engineers, constructors and financial, legal and business experts. Success in this challenging environment requires up-to-date and proven leadership and management skills. This course covers the basic components of management planning, organizing, directing, controlling and decision-making. It defines the engineering and construction team and discusses leadership styles. This course also addresses the management of change, external factors that shape decisions, the development of personal leadership abilities and, ultimately, 21st century leadership requirements.

**Prerequisite(s):** Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### CE 8713 Construction and the Law

3 Credits Construction industry executives need not be legal experts, but they must be aware of the legal issues affecting their industry and their bottom line. This course uses the case study method to lead students through the concepts of design and construction law. The course focuses on the interface of legal, business and technical issues and their resolution. It includes the design and organization of construction documents; the legal aspects of bidding, subcontracting, bonds, insurance, mechanic’s liens, etc; and the implication of delays, changes and charged conditions. Alternative dispute resolution (ADR) methods are introduced.

**Prerequisite(s):** Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### CE 8723 How to Succeed in Construction

3 Credits This course leads students through the how-to’s of running a successful, large, complex construction company. It analyzes how the industry actually works, including contractual relationships with clients in all types of projects from design/build to privatization. It covers the business fundamentals of running a construction company, including issues such as surety and insurance: various types of construction organizations, domestic and international; and company culture – inner-workings of a business that can mean the differences between success and failure.

**Prerequisite(s):** Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### CE 8733 Infrastructure Financing: Structuring of a Deal

3 Credits This course examines what it takes to structure a deal from a credit perspective, legally and financially, for domestic and international projects. In the domestic sector, the course focuses on transportation projects, examining the peculiarities and the uniqueness of the capital market. Examples are studied and recent changes are discussed in areas such as financing transportation projects and the dramatically changing nature of financing these projects. In the international sector, the course covers innovative financing techniques.

**Prerequisite(s):** Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### CE 8763 Capital Program Management/Program Development
3 Credits The course examines the process of capital program management and development. Depending upon the instructor and project used for illustration, the course analyses how either the public or private sector views a project and develops it and the internal workings of an organization in determining how a project is selected, funded and managed. The course examines various contracting strategies, as well as the concepts of risk allocation, funding and project finance.

Prerequisite(s): Admission to Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8773 Dispute Avoidance and Resolution**

3 Credits This course analyzes the basic causes for construction disputes and introduces methods for dispute avoidance by proper risk allocation, management and control, as well as other techniques, including partnering. It uses the case study method to address litigation and provides an understanding of the process of arbitration and other alternative dispute resolution (ADR) methods such as negotiation, mediation, mini trials and dispute review boards.

Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8783 Construction Management and Planning**

3 Credits Strategic planning is indispensable to achieving superior management. This course in business planning provides practical advice for organizing the planning system, acquiring and using information and translating strategic plans into decisive action. This knowledge is an invaluable resource for top and middle-level executives.

Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 8803 Infrastructure Planning for Public Works**

3 Credits This course deals with the process whereby infrastructure projects are conceived, studied and implemented. The focus will be on the management and leadership roles of the key players in public works agencies. Lectures, reading assignments and classroom discussions will deal with both routine procedures and controversial issues. Students will research and report on important public works projects and on special topics in infrastructure planning.

Prerequisite(s): Admission to the Exec 21 Program or permission of a Construction Management Program Director.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CE 9903 Case Study in Urban Systems Engineering and Management**

3 Credits This comprehensive independent case study involves a specific urban infrastructure engineering and management project under faculty adviser guidance and generally is coordinated with a participating infrastructure agency. Case studies are submitted as formal reports and must be presented and defended formally. Students are expected to prepare a project report on a selected IMS in cooperation with an infrastructure agency.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CE 9910 Seminar in Civil Engineering

0 Credits Recent developments in civil engineering are presented by engineers from industry and academia. Four semesters.

Note: Open only to current PhD students

CE 9963 MS Project in Civil & Urban Engineering

3 Credits This project involves analytical, design or experimental studies in civil engineering guided by a faculty adviser and following departmental guidelines. A written report is required.

Prerequisite(s): Degree status and project adviser’s approval.

CE 9973 Thesis for MS in Civil Engineering

3 Credits This course is an original investigation or design in the student’s principal field of study prepared and closely supervised by a faculty adviser. Candidates must successfully defend theses orally. Registration for a minimum of 6 credits is required.

Prerequisite(s): Degree status and thesis adviser’s approval.

Computer Science

Undergraduate Courses

Students are advised to consult the Schedule of Classes for changes in prerequisites effective after publication of this catalog. Students may not register for any junior- or senior-level courses until they complete all freshman requirements.

Graduate Courses

Graduate courses in computer science are regularly offered on each campus, either annually or in two- or-three year cycles.

Computer Science

Undergraduate Courses

Students are advised to consult the Schedule of Classes for changes in prerequisites effective after publication of this catalog. Students may not register for any junior- or senior-level courses until they complete all freshman requirements.

Graduate Courses
Graduate courses in computer science are regularly offered on each campus, either annually or in two- or three-year cycles.

**CS 1 Pre-college Computer Science**

*NC Credits* This is an introductory course in engineering problem solving and computer programming for all undergraduate HEOP freshmen without experience in programming in any languages. The course covers the fundamentals of computer programming and its underlying principles and uses the MATLAB programming language.

| Weekly Lab Hours: 3 | Weekly Recitation Hours: 0 |

**CS 205 Assembly Language and Systems Programming**

*3 Credits* This course covers internal representation of numeric and character data. Topics: Machine organization and machine language programming, Assembly language, assemblers. Assembly language programming: branching, arrays, lists, arithmetic and bit manipulation, macros, stacks, subroutines, parameter passing, recursion. Linking and loading, position independent and reentrant code. Traps and interrupts.

*Prerequisite(s):* CS 2134 (C- or better).

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 239 UNIX System Programming**

*3 Credits* This course covers programming and system administration of UNIX systems. Also covered: Shell programming, special purpose languages, UNIX utilities, UNIX programming tools, systems programming and system administration.

*Prerequisite(s):* CS 3224 and junior status.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 308 Introduction to Databases**

*3 Credits* This course introduces database systems and their approach as a mechanism to model the real world. The course covers data models (relational, object-oriented), physical database design, query languages, query processing and optimization, as well as transaction management techniques. Implementation issues, object oriented and distributed databases also are introduced.

*Prerequisite(s):* CS 2134.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 391 Java and Web Design**

*3 Credits* Programmers familiar with C or C++ learn to develop Java applications and applets. This course teaches the syntax of the Java language, object-oriented programming in Java, creating graphical user interfaces (GUI) using the Java 2 Platform technology event model, Java exceptions, file input/output (I/O) using Java Foundation Class threads and networking.
Prerequisite(s): CS 2134.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 392 Computer Security

3 Credits This course covers cryptographic systems. Topics: Capability and access control mechanisms, authentication models, protection models. Database and operating system security issues, mobile code, security kernels. Malicious code, Trojan horses and computer viruses. Security policy formation and enforcement, legal aspects and ethical aspects.

Prerequisite(s): CS 2214 and MA 2312. Corequisite(s): CS 3224.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 393 Network Security

3 Credits This course covers reviews networking. Topics: Basic notations of confidentiality, integrity, availability; cryptographic systems, coding and decoding messages. Cryptographic protocols for privacy, integrity, key exchange and access control. TCP/IP security; Firewalls, IPSec; secure ecommerce. Intrusion detection, prevention, response. Advanced topics are included.

Prerequisite(s): CS 3224 and CS 6843, or EE 136, EL 5363 or EL 5373.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 394 Special Topics in Computer Science

This variable-credit special topics course is for juniors and seniors.

Prerequisite(s): Departmental permission.

CS 997X MS Thesis in Computer Science

Variable credits Credits Exceptional students may elect to write a master’s thesis for which no more than 6 credits may be earned toward the degree. Such research should demonstrate adequately the student’s proficiency in the subject material. Also required: oral thesis defense before at least three professors, plus a formal, bound thesis volume. Thesis registration must be continuous.

Prerequisite(s): Graduate status and satisfactory grades in prescribed courses.

CS 999X PhD Dissertation in Computer Science

Variable credits Credits The dissertation is an original investigation of a computer-science problem. The dissertation must demonstrate creativity and include features of originality and utility worthy of publication in a recognized journal. Candidates must orally defend their dissertations successfully. Registration of 21 credits and continuous dissertation registration are required.
Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam, graduate standing, and dissertation advisor approval

CS 1012 Introduction to Computer Engineering

2 Credits This course helps students to understand computer engineering as a balance among hardware, software, applications and theory, the notion of abstraction, computer layers and how they related to various aspects of computer engineering, implementation of abstract and physical computer layers: Number systems, digital logic, basic processor structure, instruction set architecture, machine learning, assembly languages and high-level programming in C. Other computer concepts, including compilers, operating systems, and algorithms presented, along with the simulator concept and its usage for understanding computer design, testing and analysis. Experts present special topics in the area. Also discussed are invention, innovation, entrepreneurship and ethics in these topics and in Computer Engineering.

Also listed under: EE 1012.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 1114 Introduction to Programming and Problem Solving

4 Credits This course introduces problem solving and computer programming and is for undergraduate Computer Science and Computer Engineering majors who have limited prior experience in programming in any language. The course covers fundamentals of computer programming and its underlying principles using the Python programming language. Concepts and methods introduced in the course are illustrated by examples from various disciplines.

Corequisite(s): EG 1 Examination Hour
Note: Weekly laboratory required.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CS 1122 Computer Science and Engineering

2 Credits This is a breadth-first course that introduces computer-science majors to several subdisciplines in the computer-science field. The course is built around the theme that computer science is the study of algorithms and includes much more than programming. The course introduces hardware, virtual machines, software, applications and social issues in computing.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 1124 Object Oriented Programming

4 Credits This intermediate-level programming course teaches object-oriented programming in C++. Topics: Pointers, dynamic memory allocation and recursion. Classes and objects including constructors, destructors, methods (member functions) and data members. Access and the interface to relationships of classes including composition, association and inheritance. Polymorphism through function overloading operators. Inheritance and templates. The standard template library is used to introduce elementary data structures and their use. Grade of C- or better required of computer science and computer engineering majors. Weekly laboratory required.
CS 1133 Engineering Problem Solving and Programming

3 Credits This introductory course in engineering problem solving and computer programming is for all undergraduate engineering students without prior programming experience in any language. The course covers the fundamentals of computer programming and its underlying principles using the MATLAB programming language. Concepts and methods are illustrated by examples from various engineering disciplines. Useful numerical techniques and their applications to real world problems in science and engineering are also discussed. Weekly laboratory required.

Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 3

CS 1213 Introduction to Programming with Java

3 Credits This introductory course in computer programming and problem solving is for students in the Digital Media program. The course is taught in the Java programming language of Java’s interactive multi- capabilities. Students learn the main components and features of Java, understand the elements of Object Oriented Programming and how they relate to Java, and write applications and applets that can be incorporated into HTML documents for the World Wide Web. Students also learn programming methodology, which involves thinking about the best way to plan the design using object-oriented design and appropriate features of Java. Also covered is methodical and efficient development of the implementation using step-wise refinement, incremental testing and debugging.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 2134 Data Structures and Algorithms

4 Credits This course covers abstract data types and the implementation and use of standard data structures. Topics: Fundamental algorithms and the basics of algorithm analysis. A grade of C- or better is required of undergraduate computer science and computer-engineering majors.

Prerequisite(s): CS 1124 (C- or better) and MA 1024. Corequisite(s): MA 2312/MA 2322.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 2164 Introduction to Programming in C

CS 2204 Digital Logic and State Machine Design

4 Credits This course covers combinational and sequential digital circuits. Topics: Introduction to digital systems. Number systems and binary arithmetic. Switching algebra and logic design. Error detection and correction. Combinational integrated circuits, including adders. Timing hazards. Sequential circuits, flip-flops, state diagrams and synchronous machine synthesis. Programmable Logic Devices, PLA, PAL and FPGA. Finite-state machine design. Memory elements. Weekly laboratory experiments introduce digital system design on FPGAs. A grade of C- or better is required of undergraduate computer engineering majors.

Prerequisite(s): CS 1114 (C- or better) or CS 1133 (C- or better).
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CS 2214 Computer Architecture and Organization

4 Credits This course covers a top/down approach to computer design. Topics: Computer architecture, introduction to assembly language programming and machine language set design. Computer organization, logical modules; CPU, memory and I/O units. Instruction cycles, the datapath and control unit. Hardwiring and microprogramming. The memory subsystem and timing. I/O interface, interrupts, programmed I/O and DMA. Introduction to pipelining and memory hierarchies. Fundamentals of computer networks. Weekly recitations support lecture topics and study homework assignments.

Prerequisite(s): CS 2204 (C- or better) for computer engineering majors; CS 2134 (C- or better) and MA 2312/MA 2322 for computer science majors.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 2

CS 3113 Game Programming

3 Credits A programming intensive introduction to the creation of computer games. Using mostly two-dimensional sprite-based programming, we examine and experiment with animation, physics, artificial intelligence and audio. In addition, the course explores the mathematics of transformations (both 2D and 3D) and the ways they may be represented.

Prerequisite(s): CS 2134 (C- or better).
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 3224 Operating Systems

4 Credits This course studies the fundamental concepts and principles of operating systems. Batch, spooling and multiprogramming systems are introduced. The parts of an operating system are described in terms of their functions, structure and implementation. Basic policies for allocating resources are discussed.

Prerequisite(s): CS 2214 and CS 2134 (C- or better).
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CS 3233 Game Development Studio I

3 Credits This class introduces the principles of 2D and 3D computer game design. Students learn about the range of game types and understand their conceptual building blocks. Students complete a structured sequence of assignments towards the design for a new game.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 3254 Introduction to Parallel and Distributed Systems

4 Credits This course offers a solid grounding in the basic issues and techniques of parallel and distributed computing. The material covers the spectrum from theoretical models of parallel and distributed systems to actual programming assignments.

Prerequisite(s): CS 2134.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

CS 3314 Design and Implementation of Programming Languages

4 Credits This course covers issues underlying the design of high-level programming languages, along with elements of the compiler technology used to translate those languages into executable code. Topics covered include formal description of language syntax, parsing, memory management, attributes of variables and their binding times, control and data abstraction mechanisms and object-oriented language features. The focus is on imperative and object-oriented languages, with brief introduction to functional and logic-programming paradigms. Substantial programming projects are required.

Prerequisite(s): CS 2134 (C- or better) and MA 2312.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 3413 Design and Analysis of Algorithms

3 Credits This course covers fundamental principles of the design and analysis of algorithms. Topics include asymptotic notation, recurrences, randomized algorithms, sorting and selection, balanced binary search trees, augmented data structures, advanced data structures, algorithms on strings, graph algorithms, geometric algorithms, greedy algorithms, dynamic programming and NP completeness.

Prerequisite(s): CS 2134 (C- or better) and MA 2312/MA 2322.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 3513 Software Engineering I

3 Credits This course is the first of a two-course sequence of a design project (DP I and DP II). Focusing on software engineering, the course introduces techniques to specify, design, test and document medium and large software systems. Design techniques include information engineering, object orientation and complexity measures. Also covered are testing methods, such
as path testing, exhaustive test models and construction of test data. An introduction to software tools and project management techniques is presented. Student projects involve team software development and tracking.

Prerequisite(s): CS 2134 (C- or better), CS 3224 and senior status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 3714 Secure Information Systems Engineering I

4 Credits This course develops an approach to secure information-systems engineering consistent with today’s vulnerabilities, threats and risks. Grounding is established in the basic security technologies and strategies in use today. A concept of security engineering is constructed for whole elements of the critical infrastructure (e.g., utilities, government services, financial services, etc.) including legacy environments, the Internet, wireless and the coming evolution of ubiquitous computing.

Prerequisite(s): Junior status.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 3734 Scientific and Engineering Computing I

4 Credits This course takes advantage of the programming skills learned in introductory-level, computer-science courses to exploit the broad power of modern computing related to science and engineering disciplines. Computational techniques are taught in parallel with programming and problem-solving methodologies. Students learn to recognize a good or bad formulation of a problem, select the proper algorithm to solve a given computational problem and interpret the results. In doing so, they learn to become intelligent users, rather than creators, of computational software.

Prerequisite(s): CS 1114, MA 1124, and MA 2012/MA 2132.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 4523 Design Project II

3 Credits This is the second course in a two-course design-project sequence (DP I and DP II) Students or several students work with a faculty member and/or graduate students on a current topic in computer science. Each term, a project course with a particular theme is offered by the Department of Computer and Information Science. A faculty member assigns individual or group projects. The project course is highly structured and supervised closely by faculty. Students are expected to use the design and project-management skills they learned in CS 3513 Software Engineering. Alternatively, students may work with a faculty member on an individual project of mutual interest. A written report and oral presentation are required.

Prerequisite(s): CS 3513.
Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 4724 Secure Information Systems Engineering II

4 Credits This second semester course comprises projects, labs and discussions in Applied Secure Information Systems Engineering. Specifically, students build a comprehensive platform for secure computing based on best of breed, Open Source components starting with OpenBSD or a similar one. This platform is then contrasted with Java Security and with the secure
computing efforts of Microsoft and its associates. A “Student Hackathon” is conducted to test findings and assumptions. Finally, recommendations are made to support the future security-procurement needs for whole elements of the critical Infrastructure.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 4744 Scientific and Engineering Computing II

4 Credits Making use of the knowledge acquired in Part I of the course, the second semester focuses on well-recognized, major computational developments with the greatest influence on the development and practice of science and engineering in the last century. The course draws upon a variety of computational problems from the breadth of science and engineering to interest students and to establish the relevance of the computational problem-solving approach. Students undertake projects.

Prerequisite(s): CS 3734.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 5303 Introduction to Programming and Problem Solving

3 Credits This course introduces discrete mathematics, computers and programming; Running C/C++ programs under Unix; algorithmic language; pseudo code; problem solving and program structure. Topics include constants, variable, data types, assignments, arithmetic expressions, input and output; object-oriented and top-down design and procedures, selection and loops; functions; enumerated; arrays, structs and searching and sorting.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 5403 Data Structures and Algorithms

3 Credits This course introduces data structures. Topics include program specifications and design; abstract data types; stacks, queues; dynamic storage allocation; sequential and linked implementation of stacks and queues; searching methods, sequential and binary; binary trees and general trees; hashing; computational complexity; sorting algorithms: selection sort, heap sort, mergesort and quicksort; comparison of sorting techniques and analysis.

Prerequisite(s): Graduate status and CS 5303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6003 Foundations of Computer Science

3 Credits This course covers logic, sets, functions, relations, asymptotic notation, proof techniques, induction, combinatorics, discrete probability, recurrences, graphs, trees, mathematical models of computation and undecidability.
Prerequisite(s): Graduate status. Corequisite(s): CS 5303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6005-6025 Variable Credit Project/ Course

For students needing .5, 1, 1.5, 2 and 2.5 credit hours to meet graduation requirements, a project or special course is available with faculty approval.

CS 6033 Design and Analysis of Algorithms I

3 Credits This course reviews basic data structures and mathematical tools. Topics: Data structures, priority queues, binary search trees, balanced search trees. Btrees. Algorithm design and analysis techniques illustrated in searching and sorting: heapsort, quicksort, sorting in linear time, medians and order statistics. Design and analysis techniques: dynamic programming, greedy algorithms. Graph algorithms: elementary graph algorithms (breadth first search, depth first search, topological sort, connected components, strongly connected components), minimum spanning tree, shortest path. String algorithms. Geometric algorithms. Linear programming. Brief introduction to NP completeness.

Prerequisite(s): Graduate status, CS 5403 and CS 6003.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6043 Design and Analysis of Algorithms II

3 Credits This course covers techniques in advanced design and analysis. Topics: Amortized analysis of algorithms. Advanced data structures: binomial heaps, Fibonacci heaps, data structures for disjoint sets, analysis of union by rank with path compression. Graph algorithms: elementary graph algorithms, maximum flow, matching algorithms. Randomized algorithms. Theory of NP completeness and approach to finding (approximate) solutions to NP complete problems. Selected additional topics that may vary.

Prerequisite(s): Graduate status and CS 6033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6063 Software Engineering I

3 Credits The course emphasizes the full software-engineering approach with alternative approaches. Technical emphasis is on requirements, design, development and modeling. Management issues include software cost estimating and project management. Understanding the processes applicable to the software development/ integration cycle and maintenance along with technology changes on quality and development activities is highlighted.

Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6073 Software Engineering II
3 Credits The course covers modern, advanced software engineering approaches with theory and practice orientations. Important design and management issues are analyzed and evaluated. Technical and management tradeoffs in distributed software systems are emphasized. An extensive number of real world case studies are assessed. A class project is required.

Prerequisite(s): Graduate status and CS 6063.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6083 Principles of Database Systems

3 Credits This course broadly introduces database systems, including the relational data model, query languages, database design, index and file structures, query processing and optimization, concurrency and recovery, transaction management and database design. Students acquire hands-on experience in working with database systems and in building web-accessible database applications.

Prerequisite(s): Graduate status, CS 6003 or equivalent, familiarity with basic data structures and operating system principles.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6093 Advanced Database Systems

3 Credits Students in this advanced course on database systems and data management are assumed to have a solid background in databases. The course typically covers a selection from the following topics: (1) advanced relational query processing and optimization, (2) OLAP and data warehousing, (3) data mining, (4) stream databases and other emerging database architectures and applications, (5) advanced transaction processing, (6) databases and the Web: text, search and semistructured data, or (7) geographic information systems. Topics are taught based on a reading list of selected research papers. Students work on a course project and may have to present in class.

Prerequisite(s): Graduate status and CS 6083 or equivalent, including experience with a relational database system.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6133 Computer Architecture I

3 Credits This course provides students with an understanding of computer-hardware subsystems, digital design strategies and fundamental computer-performance and capacity-improvement techniques. Combinational and sequential circuits are developed for the essential building blocks of computers. Binary number systems are presented in both human and computer algorithms. A uniprocessor computer is built from the blocks developed. An assembly language and an instruction set are presented. Processor implementation with a data path and hardwired and microprogrammed control is introduced. Performance evaluation of computers is studied. Basic pipelining is introduced to improve system performance. Memory-hierarchy alternatives are introduced to improve the capacity of the computing system.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6143 Computer Architecture II
CS 6183 Fault-Tolerant Computers

3 Credits This course introduces a variety of hardware and software techniques to design and model fault-tolerant computers. Topics include coding techniques (Hamming, SECSED, SECDED, etc.); majority voting schemes (TMR); software redundancy (Nversion programming); software-recovery schemes; network reliability design and estimation. The course introduces probabilistic methods for reliability modeling. Other topics: Examples from space fault tolerant systems, networks, commercial nonstop systems (TANDEM and STRATUS), RAID memory systems. Fault-tolerant modeling tools such as HARP, SHURE and SHARPE.

Prerequisite(s): Graduate status and CS 6133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6233 Introduction to Operating Systems

3 Credits This course introduces basic issues in operating systems. Topics: Threads, processes, concurrency, memory management, I/O Control and case studies.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6243 Operating Systems II

3 Credits This course surveys recent important commercial and research trends in operating systems. Topics may include virtualization, network server design and characterization, scheduling and resource optimization, file systems, memory management, advanced debugging techniques, data-center design and energy utilization.

Prerequisite(s): CS 6233.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6253 Distributed Operating Systems

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CS 6273 Performance Evaluation of Computer Systems

3 Credits This course focuses on modeling and performance analysis of computer systems. It concentrates on testing and evaluation of three-tiered distributed client/server and WEB-based systems and generally on distributed networking systems. The course presents and evaluates various systems architectures from a macro and micro viewpoint.

Prerequisite(s): Graduate status and EL 5363 or MA 2212/MA 2222 and instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6313 Information Visualization

3 Credits An introductory course on Information Visualization based on a modern and cohesive view of the area. Topics include visualization design, data principles, visual encoding principles, interaction principles, single/multiple view methods, item/attribute, attribute reduction methods, toolkits, and evaluation. Overviews and examples from state-of-the-art research will be provided. The course is designed as a first course in information visualization for students both intending to specialize in visualization as well as students who are interested in understanding and applying visualization principles and existing techniques.

CS 6323 Large-Scale Visual Analytics

3 Credits Visual analytics combines interactive visual interfaces and information visualization techniques with automatic algorithms to support analytical reasoning through human-computer interaction. People use visual analytics tools and techniques to synthesize information and derive insight from massive, dynamic, ambiguous, and often conflicting data, and to communicate their findings effectively for decision-making. This course will serve as an introduction to the science and technology of visual analytics and will include lectures on both theoretical foundations and application methodologies. The goals of this course are for students to develop a comprehensive understanding of this emerging, multidisciplinary field, and apply that understanding toward a focused research problem in a real-world application or a domain of personal interest.

Prerequisite(s): CS 6313

CS 6333 Massive Data Analysis

3 Credits Big Data requires the storage, organization, and processing of data at a scale and efficiency that go well beyond the capabilities of conventional information technologies. In this course, we will review the state of the art in Big Data analytics. In addition to covering the specifics of different platforms, models, and languages, we will also look at real applications that perform massive data analysis and how they can be implemented on Big Data platforms. Topics we will discuss include: Map reduce/Hadoop, NoSQL stores, languages such as Pig Latin and JAQL, large-scale data mining and visualization. The course will primarily consist of technical readings and discussions. It will also include programming projects where the participants will prototype data-intensive applications using existing Big Data tools and platforms.

Prerequisite(s): CS 6083

CS 6373 Programming Languages
3 Credits This course covers the structures, notations and semantics of programming languages. Topics: Issues of scope, type structure and parameter passing. Control structures, including support for exception handling and concurrency. Abstract data types and object oriented languages. Programming in the large. Implementation issues. Functional, logic programming languages. Examples from a variety of languages.

Prerequisite(s): Graduate status and CS 5403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6413 Compiler Design and Construction

3 Credits This course covers compiler organization. Topics: Lexical analysis, syntax analysis, abstract syntax trees, symbol table organization, code generation. Introduction to code optimization techniques.

Prerequisite(s): CS 5403, CS 6133 and CS 6033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6533 Interactive Computer Graphics

3 Credits This course introduces the fundamentals of computer graphics with hands-on graphics programming experiences. Topics include graphics software and hardware, 2D line segment-scan conversion, 2D and 3D transformations, viewing, clipping, polygon-scan conversion, hidden surface removal, illumination and shading, compositing, texture mapping, ray tracing, radiosity and scientific visualization.

Prerequisite(s): Graduate status and CS 5403 or equivalents and knowledge of C or C++ programming.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6573 Penetration Testing and Vulnerability Analysis

3 Credits This advanced course in computer and network security focuses on penetration testing and vulnerability analysis. It introduces methodologies, techniques and tools to analyze and identify vulnerabilities in standalone and networked applications.

Prerequisite(s): CS 6823.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6613 Artificial Intelligence I

3 Credits Artificial Intelligence (AI) is an important topic in computer science and offers many diversified applications. It addresses one of the ultimate puzzles humans are trying to solve: How is it possible for a slow, tiny brain, whether biological or electronic, to perceive, understand, predict and manipulate a world far larger and more complicated than itself? And how do people create a machine (or computer) with those properties? to that end, AI researchers try to understand how seeing, learning, remembering and reasoning can, or should, be done. This course introduces students to the many AI concepts and techniques.
CS 6643 Computer Vision and Scene Analysis

3 Credits An important goal of artificial intelligence is to equip computers with the capability to interpret visual inputs. Computer vision and scene analysis is an AI area that deals with constructing explicit, meaningful descriptions of physical objects from images. It includes many techniques from image processing, pattern recognition, geometric modeling and cognitive processing. This course introduces the many techniques and applications of computer vision and scene analysis.

Prerequisite(s): Graduate status, CS 5403 and MA 2012, or equivalents, or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6673 Neural Network Computing

3 Credits This course introduces neural network models and their applications. Topics: Discussion of organization and learning in neural network models including perceptrons, adalines, backpropagation networks, recurrent networks, adaptive resonance theory and the neocognitron. Implementations in general and special purpose hardware, both analog and digital. Application in various areas with comparisons to nonneural approaches. Decision systems, nonlinear control, speech processing and vision.

Prerequisite(s): Graduate status and CS 5403; some familiarity with matrix notation and partial derivatives is recommended.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6703 Computational Geometry

3 Credits This course introduces data structures and algorithms for geometric data. Topics include intersection, polygon triangulation, linear programming, orthogonal range searching, point location, Voronoi diagrams, Delaunay triangulations, arrangements and duality, geometric data structures, convex hulls, binary space partitions, robot motion planning, quadtrees, visibility graphs, simplex range searching.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6753 Theory of Computation

3 Credits This course introduces the theory of computation. Topics: Formal languages and automata theory. Deterministic and non-deterministic finite automata, regular expressions, regular languages, context-free languages. Pumping theorems for regular and context-free languages. Turing machines, recognizable and decidable languages. Limits of computability: the Halting Problem, undecidable and unrecognizable languages, reductions to prove undecidability. Time complexity, P and NP, Cook-Levin theorem, NP completeness.

Prerequisite(s): Graduate status and CS 6003 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
CS 6803 Information Systems Security Engineering and Management

3 Credits This course presents a system and management view of information security: what it is, what drives the requirements for information security, how to integrate it into the systems-design process and life-cycle security management of information systems. A second goal is to cover basic federal policies on government information security and methodologies. Topics include information-security risk management, security policies, security in the systems-engineering process, laws related to information security and management of operational systems.

Prerequisite(s): Graduate status and CS 392 or equivalent.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6813 Information, Security and Privacy

3 Credits This course introduces Information Systems Security and covers cryptography, capability and access control mechanisms, authentication models, security models, operating systems security, malicious code, security policy formation and enforcement, vulnerability analysis, evaluating secure systems.

Prerequisite(s): Graduate status.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6823 Network Security

3 Credits This course begins by covering attacks and threats in computer networks, including network mapping, port scanning, sniffing, DoS, DDoS, reflection attacks, attacks on DNS and leveraging P2P deployments for attacks. The course continues with cryptography topics most relevant to secure networking protocols. Topics covered are block ciphers, stream ciphers, public key cryptography, RSA, Diffie Hellman, certification authorities, digital signatures and message integrity. After surveying basic cryptographic techniques, the course examines several secure networking protocols, including PGP, SSL, IPsec and wireless security protocols. The course examines operational security, including firewalls and intrusion-detection systems. Students read recent research papers on network security and participate in an important lab component that includes packet sniffing, network mapping, firewalls, SSL and IPsec.

Prerequisite(s): Graduate status and EL 5363 or CS 6843.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6843 Computer Networking

3 Credits This course takes a top-down approach to computer networking. After an overview of computer networks and the Internet, the course covers the application layer, transport layer, network layer and link layers. Topics at the application layer include client-server architectures, P2P architectures, DNS and HTTP and Web applications. Topics at the transport layer include multiplexing, connectionless transport and UDP, principles or reliable data transfer, connection-oriented transport and TCP and
TCP congestion control. Topics at the network layer include forwarding, router architecture, the IP protocol and routing protocols including OSPF and BGP. Topics at the link layer include multiple access protocols, ALOHA, CSMA/CD, Ethernet, CSMA/CA, wireless 802.11 networks and link layer switches. The course includes simple quantitative delay and throughput modeling, socket programming and network application development and Ethereal labs.

Prerequisite(s): Graduate status and CS 2134.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6873 Project in Telecommunication Networks

3 Credits In this course, students design, develop and test communication software. Students work in small groups under faculty direction. Students have access to network resources for their work.

Prerequisite(s): Graduate status and CS 6843 and instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6903 Modern Cryptography

3 Credits This course examines modern cryptography from a theoretical perspective, with an emphasis on “provable security.” The course looks particularly at cryptographic primitives that are the building blocks of various cryptographic applications. The course studies notions of security for a given cryptographic primitive, its various constructions and respective security analysis based on the security notion. The cryptographic primitives covered include pseudorandom functions, symmetric encryption (block ciphers), hash functions and random oracles, message authentication code, asymmetric encryption and digital signatures. Time permitting, the course covers how to build secure cryptographic protocols for authenticated key exchange, using the primitives studied. Also covered: various number-theoretic assumptions upon which cryptography is based.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6913 Web Search Engines

3 Credits This course covers the basic technology underlying Web search engines and related tools. The main focus is on large-scale Web search engines (such as Google, Yahoo and MSN Search) and their underlying architectures and techniques. Students learn how search engines work and get hands-on experience in how to build search engines from the ground up. Topics are based on a reading list of recent research papers. Students must work on a course project and may have to present in class.

Prerequisite(s): Good programming skills and graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6923 Machine Learning

3 Credits This course introduces the field of machine learning and covers standard machine-learning techniques, such as decision trees, nearest neighbor, Bayesian methods, support vector machines and logistic regression. Topics: Basic concepts in computational learning theory including the PAC model and VC dimension. Methods for evaluating and comparing machine
learning techniques.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 6963 Digital Forensics

3 Credits This course introduces information-technology professionals to the application of forensic science principles and practices for collecting, preserving, examining, analyzing and presenting digital evidence. The course includes selected topics from the legal, forensic and information-technology domains and uses lecture, laboratory and written projects to illustrate these topics.

Prerequisite(s): Graduate status.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 9013 Selected Topics in Computer Science

3 Credits This course covers topics of current interest in computer science. Recent offerings include software specification and validation, parallel algorithms and architectures, client-server systems and advanced object-oriented design (Java). Advanced topics: Databases, performance analysis, computer simulation, Java programming, Unix programming, human and computer interaction, cryptography with financial applications and biometric identification.

Prerequisite(s): Graduate Standing, and specified when course is offered.

CS 9023 Web Technologies and Integrated Environments

3 Credits Application Architecture in a three tier (web client, application server and data base server) environment is explained and analyzed. The impact of relevant open source tools (MySQL, CSS, AJAX etc. on the final application architecture is examined. Different integrated environments are contrasted. The content of this course is expected to change each semester as technology emerges.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

CS 9033 Web Services and SOA

3 Credits The service oriented architecture (SOA) is the latest application integration paradigm in the industry, developed to address the challenges of software development which anticipates the internal friction of interacting with incompatible architectures and programming models. SOA is a model of distributed software components which encapsulates business function in a reusable, composable way. SOA components, or services, are accessible using standardized protocols and are composed (or choreographed) into new applications using standard composition languages. The term “Web services” stands for a realization of the SOA paradigm as a set of XML based standards for component communication, description and composition.
Middleware is software that allows different applications to interact on typically distributed computer systems.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 9093 Biometrics**

3 Credits The course concentrates on the unique advantages that biometrics brings to computer security. The course also addresses such challenging issues as security strength, recognition rates and privacy, as well as alternatives of passwords and smart cards. Students gain knowledge in the building blocks of this field: image and signal processing, pattern recognition, security and privacy and secure system design. By the end of the course students are able to evaluate and design security systems that include biometrics.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 9163 Application Security**

3 Credits This course addresses the design and implementation of secure applications. Concentration is on writing software programs that make it difficult for intruders to exploit security holes. The course emphasizes writing secure distributed programs in Java. The security ramifications of class, field and method visibility are emphasized.

Prerequisite(s): Graduate status.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**CS 9223 Selected Topics in Computer Science**

3 Credits This course covers topics of current interest in computer science. Recent offerings include software specification and validation, parallel algorithms and architectures, client-server systems and advanced object-oriented design (Java). Advanced topics: Databases, performance analysis, computer simulation, Java programming, Unix programming, human and computer interaction, cryptography with financial applications and biometric identification.

Prerequisite(s): Graduate status; others specified when course is offered.

**CS 9413 Readings in Computer Science I**

3 Credits This course is primarily for advanced graduate students who wish to study in a specialized area under faculty supervision. Permission of the graduate director is required, as are regular meetings with the adviser. An examination or term report is required.
Prerequisite(s): Graduate status.
Note: Students may register and receive credit for these courses more than once.

CS 9423 Readings in Computer Science II

3 Credits This course is primarily for advanced graduate students who wish to study in a specialized area under faculty supervision. Permission of the graduate director is required, as are regular meetings with the adviser. An examination or term report is required.

Prerequisite(s): Graduate status.
Note: Students may register and receive credit for these courses more than once.

CS 9963 Advanced Project in Computer Science

3 Credits This course permits the student to perform research in computer science with a narrower scope than a master’s thesis. Acceptance of a student by a faculty adviser is required before registration. A project report and an oral examination on it are required.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Culture, Arts and Media

CAM 200x Special Topics in Culture, Arts and Media

Variable Credits This course discusses selected topics and issues in culture, arts and media at the 2000 level.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

CAM 300x Special Topics in Culture, Arts and Media

Variable Credits This course looks at selected topics and issues in culture, arts and media at the 3000 level.
Prerequisite(s): One Level 2 CAM cluster humanities and social sciences elective.
Note: Satisfies a humanities and social sciences elective.

Digital Media

DM 997X MS Thesis in Integrated Digital Media

3-6 Credits This 6-credit course is the capstone of the MS program in Integrated Digital Media. Each student, guided by a thesis adviser and with the other faculty support as required by the specific project, completes a major media-production project. The thesis form and format are determined by agreement between the student and adviser with department approval. The goal is to advance the student’s career and to contribute to the profession. Students are encouraged to seek professional outlets for their thesis. The department and NYU-Poly will do everything possible to help ensure that graduates’ excellent work find an audience and a market. The thesis may be undertaken in consecutive 3-credit increments, or all at once by agreement with the thesis adviser.

DM 1113 Audio Foundation Studio

3 Credits This course, an orientation to the essential concepts and practices of acoustic media, is a creative and theoretical foundation studio. It combines an orientation to sound and listening with the fundamentals of digital audio production: project planning, recording and mixing. The course emphasizes high-quality field recording and mobile (laptop) postproduction.

Corequisite(s): EW 1013.

DM 1123 Visual Foundation Studio

3 Credits This studio introduces the fundamentals of visual communication design: color, composition, motion and interaction. The primary creation tool will be Processing, a Java-based graphics development tool for nonprogrammers. Once students learn general compositional principles with Processing, they are introduced to video for capturing color, form and motion.

Prerequisite(s): EW 1013 and CS 1213. Corequisite(s): EW 1023.

DM 2113 Sound Studio 1

3 Credits This course follows the general principles treated in DM 1113 with a series of more advanced projects, organized to reflect the practical realities of professional work: elements of preproduction, production and postproduction for different genres.
Students are expected to demonstrate not only an understanding of the principles and tools, but also a true commitment to quality. Projects may be narrative/dramatic or music according to each student’s skills and goals.

*Prerequisite(s):* EW 1023 and DM 1113.

**DM 2123 Cinema Studio 1**

*3 Credits* In this course, students complete a coordinated sequence of short projects that add up to a finished, live-motion video project. The course strongly emphasizes the relevance of particular tools and techniques to the specific project. Concepts are introduced through the screening of historical examples from 1895 to the present. The course format is modeled on professional standards and workflow for preproduction, production and postproduction.

*Prerequisite(s):* EW 1013 and EW 1023.

**DM 2133 3d Graphics Studio 1**

*3 Credits* In this studio introduction to creative work with 3D graphics, students learn and apply fundamental principles and technical requirements for 3D model construction and surfacing for a broad range of applications from animation and game development to rapid prototyping and simulation. Individual imaginative experiments are highly encouraged.

*Prerequisite(s):* EW 1013 and EW 1023.

**DM 2143 Interaction Design Studio 1**

*3 Credits* To design interfaces requires an understanding of how humans interpret visual, tactile and auditory phenomena and how these perceptions inform their actions in the physical world. This course familiarizes students with the relevant principles of cognition and address basic interaction design issues through two solo projects and one group project.

*Prerequisite(s):* DM 1123.

**DM 2153 Game Development Studio 1**

*3 Credits* This class introduces the principles of 2D and 3D computer-game design. Students learn the range of game types and understand their conceptual building blocks. Students complete a structured sequence of assignments toward the completion of a new-game design. Students prepare through a staged sequence of assignments a fully worked-out design for an original game. Criteria include storyline quality, graphics quality and appropriateness of design to the game concept originality. For games with an educational or instructional purpose, clarity and effectiveness for the target audience is considered.

*Prerequisite(s):* DM 1123.

**DM 2183 Digital Photography Studio 1**
3 Credits This studio is a general introduction to digital photography in its two most fundamental aspects: as a technology and as an art form. Students explore fundamentals of color, composition and narrative through structured assignments, leading to the presentation of a final portfolio. Technique is developed to professional standards, making the most of simple equipment and studio setup.

Prerequisite(s): EW 1013 and EW 1023.

DM 2193 Web Studio 1

3 Credits Assignments in this web-design project studio are arranged in sequence to enable the production of a website of professional quality in design and production. The studio is for those seriously interested in web design and stresses interactivity, usability and the quality and appropriateness of look and feel. Students are expected to develop content and complete a professional-quality site.

Prerequisite(s): EW 1013 and EW 1023.

DM 3113 Sound Studio 2

3 Credits “Contemporary” in this course has two meanings. One is postclassical: minimalism, serialism and musique concrète. The other is postpopular: dub, trance and experimental. Music made largely with sampling, multitracking and found sound rather than traditional instruments is emphasized. The studio component includes developing postproduction technique as a genre in its own right. The format is two two-hour sessions a week, each split into one hour of lecture/seminar and one hour of studio/practice. Students must devote considerable out-of-class time to the written and studio components.

Prerequisite(s): DM 2113.

DM 3123 Cinema Studio 2

3 Credits Students in DM 3123 use skills developed in the prerequisite DM 2123 to explore and make the most of digital-video technology. Course themes and material center on documentary and pseudo-documentary forms. Class time is divided among hands-on technical demonstrations, group work and case studies of relevant historical work in film and video. This approach informs the high-quality and cutting-edge results expected from DM students. The emphasis on experiments and group work reflects the realities of professional production.

Prerequisite(s): DM 2123.

DM 3133 3d Graphics Studio 2

3 Credits The project is a sequence of three phases to balance the need for structure with the reality of high-quality animation work: it takes time. Students must devote considerable out-of-class time to achieve good results. Through case studies and group discussion, students are encouraged to develop creative and critical skills as well as proficiency. The course is a combination of “art” and “technique.”

Prerequisite(s): DM 2133.
DM 3143 Interaction Design Studio 2

3 Credits On-screen computer interfaces are well established. Anyone who has used a computer in the past twenty years knows how to navigate WIMP (Windows, Icons, Menus, Pointer). This course looks at the foundations of WIMP. Building upon this well-developed model, the course focuses on usability, user-testing and user-centered design. The course explores interfaces that move beyond established metaphors to provide new ways of interacting with the computer screen and starts with small assignments to illustrate concepts. The last half of the semester is spent developing a group project.

Prerequisite(s): DM 2143.

DM 3153 Game Development Studio 2

3 Credits This class continues from DM 2153, moving into advanced technological implementations of 2D games. Taking designs from DM 2153 and working in teams, students create a complete game. Students, based on abilities and individual goals, are assigned individually to work in production areas ranging from sprite creation, mapping and level design to engine coding and interaction scripting. Students are responsible for completing their assignments as if they were members of a professional game-development team.

Prerequisite(s): DM 2153.

DM 3173 Visualization and Simulation Studio

3 Credits This course is a design and production studio geared to completing a professional-quality project. Students must have the necessary design/scripting/programming skills to be prepared to make the most of them. Students are strongly encouraged to produce a project relevant to research and teaching initiatives underway in other Polytechnic programs, subject to faculty permission and counsel in the host departments.

Prerequisite(s): DM 1123.

DM 3183 Digital Photography Studio 2

3 Credits This is the second of a general two-course studio sequence in the technical and creative dimensions of digital photography. Together, the courses offer a good introduction to digital-photographic practice for non-DM majors, or an opportunity for DM majors to gain more experience in image capture and composition to apply in their graphics and video work.

Prerequisite(s): DM 2183.

DM 3193 Web Studio 2

3 Credits The assignments in this web-design project studio are arranged sequentially to enable the production of a website of professional-quality design and production. The studio, for those seriously interested in web design, stresses interactivity, usability and the quality and appropriateness of look and feel. Students also are expected to develop content and complete a
professional-quality website.

Prerequisite(s): DM 2193.

DM 3213 Computer Music Studio

3 Credits This composition-studio course aims to have each student generate music using algorithmic procedures. The studio will explore algorithmic thinking in music dating from the distant past to the present in pre-compositional and performance situations. Participants listen to a broad repertoire and learn to use a wide variety of algorithmic techniques.

Prerequisite(s): EW 1023 and DM 1113.

DM 4003 Senior Project in Digital Media

3 Credits This research/production project is completed in the final term under faculty guidance. Before the project begins, the student, instructor and program director agree on topic, approach and schedule. This studio/seminar is the capstone for DM students. Students conduct a thesis-quality design and production supervised by a faculty member active in the relevant field. Where appropriate and by special agreement, students may receive supplementary guidance from faculty in another department.

Prerequisite(s): Permission of adviser.

DM 4113 Sound Studio 3

3 Credits This course provides students the flexibility to undertake a sustained creative project. The genres developed and discussed are contemporary and intended to inform a professional-level studio practice for students committed to advancing the field, critically and creatively. Seminars led by an active practitioner culminate in the production of a public presentation.

Prerequisite(s): DM 3113.

DM 4123 Cinema Studio 3

3 Credits Students use most of their introductory and intermediate-studio experience to produce professional-quality short video pieces. Since project-management skills are a key part of proficiency at this level, projects must be largely self-directed. Appropriate group work is encouraged, though each student must take personal responsibility for specific project aspects. The class emphasizes formal structure and postproduction (editing and compositing).

Prerequisite(s): DM 3123.

DM 4133 3d Graphics Studio 3

3 Credits Students produce a complete, professional quality animation sequence showcasing skills developed in prerequisite courses. Projects may be geared to scientific, engineering or entertainment applications according to individual skills and
professional aspirations.

Prerequisite(s): DM 3133.

DM 4143 Interaction Design Studio 3

3 Credits People think of human-computer interaction as sitting in front of a monitor and using a mouse and keyboard to manipulate onscreen visual elements. In this unnatural, asymmetric interaction, humans communicate using physical input while the computer communicates visually. This model greatly restricts the possibilities. In this studio, students develop a project based on other modes of human-computer interaction, individually or within a small group, and regularly present work for class discussion and criticism.

Prerequisite(s): DM 3143.

DM 4153 Game Development Studio 3

3 Credits This class continues from DM 3153 and focuses on advanced technological implementations of 3D games, specifically the Unity 3D Game Engine, but with concepts applicable to general game production. Working in teams, students implement a complete game during the semester. Students, based on abilities and individual goals, are assigned individually to work in production areas, ranging from sprite creation, mapping and level design to engine coding and interaction scripting. Students are responsible for completing their assignments as if they were members of a professional game development team.

Prerequisite(s): DM 3153.

DM 4193 Web Studio 3

3 Credits This web-design project studio is for advanced designers and developers. It provides a rich mix of critical concepts and creative challenge for students planning a career in the field. Participants must be ready to do portfolio quality work that will open doors, whether at the cutting edge, beyond the marketplace or at the top of the heap. Students are expected to handle technical issues independently and to maximize each other’s time in class.

Prerequisite(s): DM 3193.

DM 4903-6 Undergraduate Thesis, Digital Media

3 Credits The undergraduate thesis allows students to apply knowledge gained in their major field and use it to plan, conduct and report original research. The thesis may be a discourse on a subject in students’ courses of study, an original investigation or research account, a report on a project, or an explanatory statement of an original design. All undergraduate students who plan to do a thesis should meet with the program director about topic choices at least one year before graduation. Department heads approve requests and appoint a thesis adviser. Students must register for the thesis course every fall and spring semester until it is completed and accepted.

Prerequisite(s): Permission of adviser.
DM 4911-3 Special Topics in Digital Media

3 Credits This course, completed under the DM faculty guidance, may be repeated for credit on a different topic. By special permission of the program director, this course may be offered from time to time in subjects relevant to, but not regularly offered by, the Digital Media program. To suggest a subject, students must file a course syllabus or proposal with the program office.

Prerequisite(s): Permission of adviser.

DM 6033 Media Organizations

3 Credits This course is a general orientation to a broad range of media-producing organization types from pirate radio stations and ad-hoc collectives to major corporations. Each organization has specific advantages and disadvantages, and each has a specific range of work types it can support effectively. The ultimate purpose of the course is to provide a “big-picture” orientation to the different environments in which media get made and distributed and to help students clarify goals and needs so they can make wiser choices about directing their studies and work toward the right career.

DM 6043 Media Studies Seminar

3 Credits This course provides students a critical background in media studies. This semester focuses on a particular moment in the intersection of critical philosophy, avant-garde art and political action, the Situationist International, and work that derives from, reacts against or “détourns” it. Students work through a selection of texts and media work in chronological order from the critique of urbanism to the theory of the society of the spectacle, from the practice of the dérive to détournement, and then the take-up and reaction against these theories and practices. Nearly all readings are available online. The instructor may direct students toward a website and encourage them to poke around and get to know the body of work of an artist or group.

DM 6103 Performance Studio Seminar

3 Credits This course introduces students to contemporary digital-performance techniques and issues, i.e., integrating computing technology into traditional performing arts. Drawing on contemporary research in performance studies as well as technical advances in performing arts production design, students perform research on how digital technology and media are integrated into dance, theater, performance art and concert-music performance. Students develop performance technologies as part of their research and present them to the group at the end of the semester.

DM 6113 Sound Studio Seminar

3 Credits This course introduces DM students to contemporary techniques and issues in audio, sound and musical research. The class covers digital signal processing, synthesis, musical informatics and interaction design as it applies to contemporary music production, postproduction and live performance. Students are expected to achieve competence in a number of technologies and to create brief studies based on them.

DM 6123 Cinema Studio Seminar
3 Credits Students use developed skills to explore and exploit digital-video technology. Course material centers on the documentary and its many forms. to inform the high-quality and cutting-edge results expected from Bxnc students, class time is divided between hands-on technical demonstrations, group work and case studies of relevant historical work in film and video. A range of video-documentary approaches is demonstrated and encouraged.

DM 6133 3d Studio Seminar

3 Credits This course examines topics in 3D modeling from the perspective of graduate-level research in digital media. As with video, a working understanding of technological practice vis-à-vis 3D is crucial for DM students working in interaction design, game design or computer graphics. The class explores techniques and methodologies through regular studio practice to give students an overview of the possibilities and the current state of the art, and to prepare them for thesis work or subsequent course work.

DM 6143 Interaction Design Studio Seminar

3 Credits This seminar introduces students from diverse backgrounds to interaction design as a creative design practice. The course surveys application areas, supporting technologies and their impact on individual and group relationships. Group projects introduce the collaborative and interdisciplinary development process common in the professional technology and design. Students are expected to develop technology competencies, including software programming, configuration of hardware devices and the operation of standard digital-media hardware and software tools. Students are also expected to demonstrate interpretive positions regarding analysis of the impact of technology on individuals and social interactions.

DM 6153 Game Design Studio Seminar

3 Credits This course guides graduate students through contemporary thought in game design, development, user testing and deployment. The course will benefit DM students interested in research or employment opportunities in game design or in related fields that require an understanding of human-computer interaction. This seminar provides a foundation understanding of how games are developed, tested and experienced.

DM 6193 Web Studio Seminar

3 Credits This project studio is offered for students who have web-design and/or development experience and who are ready to take on new technologies and approaches. Students may participate in large-scale projects directed by the instructor or work on a personal or small-group project. Participants are expected to complete a major semester project at a level beyond basic professional standards.

DM 6213 Networked Media Studio Seminar

3 Credits This seminar looks at the power of computer networks and their potential in digital media. Technologies such as network communication, peer-to-peer file transfer, media broadcasting, cluster and parallel computing, database research,
multiplayer online environments and online social spaces are explored with the goal of creative applications. Students complete a semester length research project based on their creative and technical interests.

DM 7033 Media Law Seminar

3 Credits This advanced seminar explores in-depth the theoretical and practical aspects of media-communications principles and regulations. Knowledge of media law is crucial for professionals. A full range of models from Open Source public license to Digital Rights Management will be explored, as well as working definitions of Fair Use and the practical limits of sampling/mixing in different idioms and economic sectors.

DM 9101-3 Special Topics in Digital Media

3 Credits Offered by special arrangement with faculty, visiting scholars and professionals in the field, this course may be repeated for credit with different topics.

Prerequisite(s): permission of adviser.

DM 9103 Special Topics in Digital Media

3 Credits Offered by special arrangement with faculty, visiting scholars and professionals in the field, this course may be repeated for credit with different topics.

Prerequisite(s): Permission of instructor.

DM/STS/URB 4033 Internship

3 Credits Students may undertake an internship for academic credit with an appropriate private, public, or non-profit agency or firm. The internship is an opportunity to extend learning outside of the classroom into a real world setting, and to explore career options tied to the major. Students complete 140 hours at the internship site and attend occasional class meetings. The course involves completing a learning contract, regular reflections, assignments, and a final presentation.

Prerequisite(s): Prerequisite: IDM/SUE/STS majors only. Permission of instructor required.

Economics
EC 2524 Managerial Microeconomics

4 Credits An advanced course in microeconomics for students with appropriate mathematical background. This course presents microeconomic analysis and its application to business decision making. Fundamentals of the Theory of the Firm, the Theory of the Consumer and market structure and competition are presented, including both theoretical models and quantitative analysis techniques. Advanced topics in information asymmetries and externalities are presented. Required for students in the BTM Program.

Prerequisite(s): MA 1252 Calculus for Business and Life Sciences IIA
Note: Does not satisfy general education requirements in humanities and social sciences. Offered and administered by Department of Technology Management.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Electrical Engineering

Undergraduate Courses

Students should consult departmental adviser postings, handouts and the department’s website for changes in required courses, course contents and prerequisites that go into effect after this catalog is published.

General prerequisites: students may not register for any junior- or senior-level courses until they complete all freshman and most sophomore requirements. For all EE courses, the Institute assumes knowledge of computer programming at the level of CS 1113 and of computational mathematics packages used in calculus courses.

Note: Elective courses whose identifiers have three numerical digits (e.g., EE 107) are listed after the courses having identifiers with four numerical digits. Courses with identifiers of the form EL XYZ, available as senior electives, are listed with graduate EE courses.

EE 107 Control System Design
3 Credits The course covers design of linear feedback control systems, selected from the following: lag-lead compensators; pole placement controllers; state-variable feedback and observers; linear quadratic optimal control, stochastic systems, sampled-data and computer-controlled systems; and phase-plane and describing function techniques for nonlinear systems.

Prerequisite(s): EE 3064.
Note: ABET competencies: a, b, c, e, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 116 Communication Electronics

3 Credits The course centers on design and analysis of small-signal and large-signal tuned amplifiers, sine-wave oscillators, mixers, AM modulators and demodulators, FM modulators and demodulators, phase-locked loops.

Prerequisite(s): EE 3124.
Note: ABET competencies: a, c, e, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 136 Communication Networks

3 Credits This course develops basic techniques used in communication networks. After protocol layering is introduced, algorithms and protocols are discussed for use in each of the five layers: physical, data link, network, transport and application. Specific protocols such as TCP/IP, ATM, SS7 are included.

Prerequisite(s): junior status in electrical engineering, computer engineering, or computer science. Corequisite(s): for EE majors: MA 3012 and MA 3112; for CompE/CS majors: MA 2212 and MA 2222.
Note: ABET competencies: a, c, e, j, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 164 Electromagnetic Fields and Radiation

3 Credits Review and mathematical interpretation of Maxwell’s Equations; basic antenna theory and radiation; antenna parameters and arrays; rectangular metal waveguides; dielectric waveguides; and applications at radio and optical frequencies are discussed.

Prerequisite(s): EE 3604.
Note: ABET competencies: a, c, e, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 210 Summer Honors Research Laboratory
3 Credits An individual or small-group intensive, 11-week research-oriented project, often related to current faculty research projects. Offered in the summer following the junior year. Students may use this course to satisfy the Technical Elective requirement or the Design Project II. A limited number of students are selected for this program based on application forms submitted in the preceding spring. (See www.poly.edu/academics/departments/electrical/research). ABET competencies: a, b, c, e, f, g, i, j, k.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 9 | Weekly Recitation Hours: 0

**EE 371 Guided Studies in Electrical Engineering**

*1 Credits* Guided study under the guidance of a faculty member of a topic related to Electrical Engineering.

*Prerequisite(s):* Adviser approval.

**EE 372 Guided Studies in Electrical Engineering**

*2 Credits* Guided study under the guidance of a faculty member of a topic related to Electrical Engineering.

*Prerequisite(s):* Adviser approval.

**EE 373 Guided Studies in Electrical Engineering**

*3 Credits* Guided study under the guidance of a faculty member of a topic related to Electrical Engineering.

*Prerequisite(s):* Adviser approval.

**EE 374 Guided Studies in Electrical Engineering**

*4 Credits* Guided study under the guidance of a faculty member of a topic related to Electrical Engineering.

*Prerequisite(s):* Adviser approval.

**EE 375 Guided Studies in Electrical Engineering**

*5 Credits* Guided study under the guidance of a faculty member of a topic related to Electrical Engineering.

*Prerequisite(s):* Adviser approval.

**EE 376 Guided Studies in Electrical Engineering**
6 Credits Guided study under the guidance of a faculty member of a topic related to Electrical Engineering.

Prerequisite(s): Adviser approval.

**EE 381 Guided Studies in Computer Engineering**

1 Credits Guided study under the guidance of a faculty member of a topic related to Computer Engineering.

Prerequisite(s): Adviser approval.

**EE 382 Guided Studies in Computer Engineering**

2 Credits Guided study under the guidance of a faculty member of a topic related to Computer Engineering.

Prerequisite(s): Adviser approval.

**EE 383 Guided Studies in Computer Engineering**

3 Credits Guided study under the guidance of a faculty member of a topic related to Computer Engineering.

Prerequisite(s): Adviser approval.

**EE 384 Guided Studies in Computer Engineering**

4 Credits Guided study under the guidance of a faculty member of a topic related to Computer Engineering.

Prerequisite(s): Adviser approval.

**EE 385 Guided Studies in Computer Engineering**

5 Credits Guided study under the guidance of a faculty member of a topic related to Computer Engineering.

Prerequisite(s): Adviser approval.

**EE 386 Guided Studies in Computer Engineering**

6 Credits Guided study under the guidance of a faculty member of a topic related to Computer Engineering.

Prerequisite(s): Adviser approval.
EE 397 Senior Thesis

As arranged Credits Independent design-oriented engineering project performed under guidance of faculty adviser. Oral thesis defense and formal, bound thesis volume required. Registration of at least 6 credits required.

Prerequisite(s): Senior status and adviser approval.
Note: Credits: variable.

EE 1002 Introduction to Electrical Engineering

2 Credits This course introduces numerous Electrical Engineering subject areas, including power systems, power electronics, computer networking, computer processors, communications, feedback control, signal processing, and EM fields/waves. As appropriate for each area, the course introduces various devices, design and operational issues, design methodologies and algorithms. Also introduced are basic equations to model systems and algorithms to solve specific problems. Important technical developments and problems are discussed. Mathematical methods are introduced as needed. The course gives an overview of department courses. Faculty lecturers discuss research and industrial projects in which they have been involved. Assignments include computer simulations and investigations of different systems. Written reports based on articles from the IEEE Spectrum Magazine are assigned. The IEEE Code of Ethics and ethics-related readings from the IEEE literature are discussed.

Prerequisite(s): CS 1133 and MA 1024.
Note: ABET competencies: i, h.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 1012 Introduction to Computer Engineering

2 Credits This course helps students to understand computer engineering as a balance among hardware, software, applications and theory, the notion of abstraction, computer layers and how they relate to various aspects of computer engineering, implementation of abstract and physical computer layers: Number systems, digital logic, basic processor structure, instruction set architecture, machine languages, assembly languages and high-level programming in C. Other computer concepts, including compilers, operating systems and algorithms, are presented, along with the simulator concept and its usage for understanding computer design, testing and analysis. Experts present special topics in the area. Also discussed are invention, innovation, entrepreneurship and ethics in these topics and in Computer Engineering.

Also listed under: Also listed under CS 1012.
Note: ABET competencies: e, h, j.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 2013 Fundamentals of Electric Circuits I

3 Credits This course covers Passive DC circuit elements, Kirchoff’s laws, electric power calculations, analysis of DC circuits, Nodal and Loop analysis techniques, voltage and current division, Thevenin’s and Norton’s theorems, and source-free and forced responses of RL, RC and RLC circuits. A minimum of C- is required to take other EE courses.
**EE 2024 Fundamentals of Electric Circuits II**

4 Credits The course continues EE 2013 and focuses on sinusoidal steady-state response; complex voltage and current and the phasor concept; impedance and admittance; average, apparent and reactive power; polyphase circuits; node and mesh analysis for AC circuits; use of MATLAB for solving circuit equations; frequency response; parallel and series resonance; and operational amplifier circuits. A laboratory meets on alternate weeks. A minimum of C- is required to take other EE courses.

Prerequisite(s): EE 2013 with C or better grade.
Note: ABET competencies a, b, c, d, e, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 1 | Weekly Recitation Hours: 1

**EE 2613 Fundamentals of Electric Power Engineering for Non EE Students**

Prerequisite(s): MA 1024, MA 1124, and PH 1013. Corequisite(s): PH 2023.
Note: ABET competencies a, d, h i, j.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EE 3054 Signals and Systems**

4 Credits This course centers on linear system theory for analog and digital systems; linearity, causality and time invariance; impulse response, convolution and stability; the Laplace, z-transforms and applications to Linear Time Invariant (LTI) systems; frequency response, analog and digital filter design. Topics also include Fourier Series, Fourier Transforms and the sampling theorem. Weekly computer-laboratory projects use analysis- and design-computer packages. The course establishes foundations of linear systems theory needed in future courses; use of math packages to solve problems and simulate systems; and analog and digital filter design.

Prerequisite(s): EE 2024 (C- or better), MA 2012 and MA 2132.
Note: ABET competencies a, b, c, e, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 1
EE 3064 Feedback Control

4 Credits This course introduces analysis and design of linear feedback-control systems; modeling of physical systems, performance specifications, sensitivity and steady-state error; Routh- Hurwitz and Nyquist Stability tests; the use of Root Locus and frequency-response techniques to analyze system performance and design compensation (lead/lag and PID controllers) to meet performance specifications. Students analyze and design control systems using math packages in the alternate-week computer laboratory. The course establishes the foundation of feedback-control theory for use in more advanced courses; introduces control-systems design concepts and practices; and develops facility with computer design packages for design and simulation.

Prerequisite(s): EE 3054 (C- or better) and PH 2023.
Note: ABET competencies: a, b, c, e, i, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

EE 3114 Fundamentals of Electronics I

4 Credits This course focuses on circuit models and amplifier frequency response, op-amps, difference amplifier, voltage-to-current converter, slew rate, full-power bandwidth, common-mode rejection, frequency response of closed-loop amplifier, gain-bandwidth product rule, diodes, limiters, clamps and semiconductor physics. Other topics include Bipolar Junction Transistors; small-signal models, cut-off, saturation and active regions; common emitter, common base and emitter- follower amplifier configurations; Field-Effect Transistors (MOSFET and JFET); biasing; small-signal models; common-source and common gate amplifiers; and integrated circuit MOS amplifiers. The alternate-week laboratory experiments on OP-AMP applications, BJT biasing, large signal operation and FET characteristics. The course studies design and analysis of operational amplifiers; small-signal bipolar junction transistor and field-effect transistor amplifiers; diode circuits; differential pair amplifiers and semiconductor device- physics fundamentals.

Prerequisite(s): EE 2024 (C- or better) and PH 2023.
Note: ABET competencies a, b, c, e, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 1

EE 3124 Fundamentals of Electronics II

4 Credits The course concentrates on differential and multistage amplifier, current mirrors, current sources, active loads; frequency response of MOSFET, JFET and BJT amplifiers: Bode plots; feedback amplifiers, gain-bandwidth rule and feedback effect on frequency response; Class A, B and AB output stages; op-amp analog integrated circuits; piecewise- linear transient response; determination of state of transistors; wave-shaping circuits; MOS and bipolar digital design: noise margin, fan-out, propagation delay; CMOS, TTL, ECL; and an alternate week laboratory. The course studies design and analysis of analog integrated circuits, frequency response of amplifiers, feedback amplifiers, TTL and CMOS digital integrated circuits.

Prerequisite(s): EE 3114.
Note: ABET competencies a, c, e, g, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0
EE 3193 Introduction to Very Large Scale Integrated Circuits

3 Credits The course offers an overview of integrated circuit-design process: planning, design, fabrication and testing; device physics: PN junction, MOSFET and Spice models; inverter static and dynamic behavior and power dissipation; interconnects: cross talk, variation and transistor sizing; logic gates and combinational logic networks; sequential machines and sequential system design; subsystem design: adders, multipliers, static memory (SRAM), dynamic memory (DRAM). Topics include floor planning, clock distribution, power distribution and signal integrity; Input/Output buffers, packaging and testing; IC design methodology and CAD tools; implementations: full custom, application-specific integrated circuit (ASIC), field programmable gate arrays (FPGA). The course provides foundations of VLSI design and custom VLSI design methodology and state-of-the-art CAD tools.

Prerequisite(s): CS 2204 (C- or better) and EE 3114.
Note: ABET competencies: a, c, e, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 3363 Real-Time Embedded Controls and Instrumentation

Prerequisite(s): EE 2024 and CS 2204 and knowledge of C programming language.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 3404 Fundamentals of Communication Theory

4 Credits The course covers bandpass signal representation and quadrature receivers; noise in communication systems; Digital Modulation Schemes, coherent and noncoherent receivers; coding fundamentals, block and convolutional codes; higher-order modulation schemes, QAM, M-PSK; intersymbol interference and equalization techniques; and carrier and symbol synchronization. Alternate-week computer laboratory projects analyze and design computer packages. The course teaches principles of various modulation and coding techniques and their relative effectiveness under transmission-environments constraints and uses math packages to analyze and simulate communication systems.

Prerequisite(s): EE 3054 (C- or better); computer engineering students may register with instructor’s approval. Corequisite(s): MA 3012.
Note: ABET competencies a, c, e, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

EE 3414 Multimedia Communication Systems I
4 Credits The course is Part I of an approved Institute Sequence in Multimedia Communications. Topics: speech and audio sampling and quantization; frequency domain characterization and processing of speech signals; speech and audio-coding standards; wired and wireless telephone systems; color perception and representation; basic image processing tools; image-coding standards; basics of packet-switching networks and Internet technology. Requirements: one term project by a team of two or more students related to course content. Objectives: to understand basic techniques for speech, audio and image processing and principles of wired and wireless telephone systems and the Internet.

Prerequisite(s): CS 1114 or CS 1133 and MA 1024.
Note: ABET competencies: a, b, d, g, h, k.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 3423 Light and Lightening

Prerequisite(s): CM 1004 and PH 2033.
Also listed under: PH 3423.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 3604 Electromagnetic Waves

4 Credits Electromagnetic wave propagation in free space and in dielectrics, starting from a consideration of distributed inductance and capacitance on transmission lines. Electromagnetic plane waves are obtained as a special case. Reflection and transmission at discontinuities are discussed for pulsed sources, while impedance transformation and matching are presented for harmonic time dependence. Snell’s law and the reflection and transmission coefficients at dielectric interfaces are derived for obliquely propagating plane waves. Guiding of waves by dielectrics and by metal waveguides is demonstrated. Alternate-week laboratory. Objectives: Establish foundations of electromagnetic wave theory applicable to antennas, transmissions lines and materials; increase appreciation for properties of materials through physical experiments.

Prerequisite(s): EE 2024 (C- or better) and MA 3112.
Note: ABET competencies: a, b, c, e, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

EE 3824 Electric Energy Conversion Systems

4 Credits Introduction to electric-energy sources, energy-storage devices, energy economics, environmental issues and electrical hazards. Principles of electric power systems transmission and distribution. Basic electromechanical conversion systems pulse and distribution transformers, induction rotating machines. Principles of electric energy conversion, static power supplies, static controllers and electric-power quality. Fundamentals of power management heat-sinks and cooling systems. Alternate-week experiments with basic electrical machines. Objectives: familiarization with energy sources, storage devices and their economical and environmental management; analysis and design of transmission and distribution systems, basic electrical machinery and power electronic converters.
EE 4001 ECE Professional Development and Presentation

1 Credits This course provides electrical and computer engineering students with concepts, theory, principles and experience in project management and project presentation. Students learn how to apply skills learned in engineering coursework to team projects in a professional environment.

Prerequisite(s): Junior or senior status or permission of the instructor.
Note: Restricted to Electrical and Computer Engineering majors. ABET competencies: a, e, f, g.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 4113 EE DPI- Control and Robotics

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 6 | Weekly Recitation Hours: 1

EE 4123 EE DPI- Electrical Power and Machinery

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses and EE 3824.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4133 EE DPI- Electromagnetic Waves and Applications

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.
Prerequisite(s): completion of all junior-level technical courses and EE 3604.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4143 EE DPI - Integrated Circuit Design

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses and EE 3124.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4144 Introduction to Embedded Systems Design

4 Credits The course covers architecture and operation of embedded microprocessors; microprocessor assembly language programming; address decoding; interfacing to static and dynamic RAM; Serial I/O, Parallel I/O, analog I/O; interrupts and direct memory access; A/D and D/A converters; sensors; microcontrollers. Alternate-week laboratory. Objectives: to provide foundations of embedded systems design and analysis techniques; expose students to system level design; and teach integration of analog sensors with digital embedded microprocessors.

Prerequisite(s): CS 2204 (C- or better) and EE 2024 (C- or better).
Note: ABET competencies: a, c, d, e, g, j, k.

Weekly Lecture Hours: 3.5 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

EE 4153 EE DPI - Multimedia

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses.
Also listed under: EL 5143
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 6 | Weekly Recitation Hours: 1

EE 4163 EE DPI - Digital Signal Processing Lab
3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses.
Also listed under: EL 6183
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4173 EE DPI- Telecommunication Networks

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills. Corequisite(s): EE 136.
Also listed under: EL 5373.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4183 EE DP I-Wireless Communication

3 Credits DP I provides significant background laboratory experience in the student’s area of concentration. Students begin independent projects by finding an adviser and initiating the project work, and exercising oral presentation and written communication skills.

Prerequisite(s): completion of all junior-level technical courses and EE 3404.
Also listed under: EL 5023.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4223 Electrical Engineering Design Project II

3 Credits In this concluding phase of the Design Project, students and their advisers continue to work on the independent project begun in the previous semester. The final project builds upon analytical and laboratory skills developed in previous required and elective courses. The project may be an individual one, or may be carried out by a student team working with a faculty group adviser. The final Capstone Project also may be a multidisciplinary project carried out with students from other departments.

Prerequisite(s): EE 41x3 [One of the following: EE 4113 EE DPI- Control and Robotics or EE 4123 EE DPI- Electrical Power and Machinery or EE 4133 EE DPI- Electromagnetic Waves and Applications or EE 4143 EE DPI- Integrated Circuit Design or EE 4153 EE DPI- Multimedia or EE 4163 EE DPI - Digital Signal Processing Lab or EE 4173 EE DPI- Telecommunication Networks or EE 4183 EE DP I-Wireless Communication .
EE 4313 Computer Engineering Design Project I

3 Credits Lectures and experiments introduce computer hardware organization, assembly language programming and interfacing computer hardware to physical devices. This course exercises the student’s oral presentation and written communication skills, and provides background necessary for beginning independent project work. Students find an adviser and choose DP II course project.

Prerequisite(s): completion of all junior-level technical courses, including minimum grade requirements.
Note: ABET competencies: a, b, c, e, f, g, k.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 1

EE 4323 Computer Engineering Design Project II

3 Credits Students work with faculty advisers in this concluding phase of their Capstone Project. This project builds upon the analytical and laboratory skills developed in previous required and elective courses. The project may be an individual one, or carried out by a team of students working with a faculty group adviser. The project also may be multidisciplinary, carried out with students from other departments. Students are required to make oral and written presentations.

Prerequisite(s): EE 4313 or CS 3513.
Note: ABET competencies: a, b, c, d, e, f, g, h, i, j, k.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 6 | Weekly Recitation Hours: 1

EE 4414 Multimedia Communication Systems II

4 Credits This course is Part II of an approved Institute Sequence in Multimedia Communications. Topics: analog and digital video format, properties of human visual systems, multiplexing of separate color components, video-coding methods and standards, analog and digital TV systems. Policy and business issues in TV system development. Video conferencing systems, video streaming over the Internet, Internet protocols for real-time applications. Requires one-term project on a topic related to the course content by a team of two or more students. Objectives: to understand basic techniques for video processing and principles of television systems and real-time services over the Internet.

Prerequisite(s): EE 3414 or EE 3054, or sufficient knowledge of Fourier Transforms.
Note: ABET competencies: a, b, d, g, h, k.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EE 4823 Electric and Hybrid Vehicles
Electric and hybrid vehicles mechanical fundamentals. DC, induction, and permanent magnet ac motors and drives. Regenerative breaking. Automotive power electronics. Fuel cells for electric vehicles. Electric Energy storage. The class meets four hours a week for lectures and recitation.

Prerequisite(s): EE 3824 and PH 2033.
Note: ABET competencies: a, c, h, k.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

Electrical Engineering (Graduate)

EL 90X3 Selected Topics in Wireless Communication (X=1, 2, 9)

3 Credits This course covers selected topics of current interest in wireless communications. (See department for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 91X3 Selected Topics in Signal Processing (X=1, 2, ...,9)

3 Credits The course centers on selected topics of current interest in signals and systems. (See departmental mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 92X3 Selected Topics in Control Systems (X=1, 2, ...,9)

3 Credits The course discusses topics of current interest to feedback and control-system engineers. (See department mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 93X3 Selected Topics in Telecommunications and Networking (X=1, 2,...9)

3 Credits The course covers selected topics of current interest in telecommunications and networking. (See departmental mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 94X3 Selected Topics in Computer Electronic Devices and Systems (X=1, 2,...9)

3 Credits This course examines special topics of current interest in the field of electronic devices, circuits and systems. (See departmental mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 95X3 Selected Topics in Electro- Optics, Quantum Electronics and Material Science (X=1, 2,...9)

3 Credits The course covers topics of current interest dealing with the interaction of matter with electromagnetic fields. (See departmental mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 96X3 Selected Topics in Power Engineering (X=1, 2,...9)

3 Credits The course looks at topics of current interest in electric power engineering. (See departmental mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 97X3 Selected Topics in Electrodynamics, Wave Phenomena and Plasmas (X=1, 2,...9)

3 Credits The course discusses topics of current interests in plasmas, electromagnetic and acoustic wave propagation, diffraction and radiation, including wave interactions with plasmas, materials and special mathematical and numerical techniques. (See departmental mailing for detailed description of each particular offering.)

Prerequisite(s): Specified when offered.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 997x MS Thesis in Electrical & Computer Engineering Department

Variable Credits Credits The student is required to conduct a theoretical and/or experimental project in a research area in electrical engineering, computer engineering, electrophysics, system engineering, or telecommunication networks. The project is chosen based on the student’s specialized interest and preparation and is guided by a faculty member who is expert in the chosen subject. Oral-thesis defense and formal, bounded thesis are required. Registration of at least 6 credits over continuous semesters is required. A student must secure a thesis adviser before registration.

Prerequisite(s): Degree status.

EL 999X PhD Dissertation in Electrical Engineering

Variable Credits Credits The dissertation is an original investigation of an electrical-engineering problem. The work must demonstrate creativity and include features of originality and utility worthy of publication in a recognized journal. Candidates must successfully defend their dissertations orally and submit a bounded thesis. Registration of at least 21 credits over continuous semesters is required.

Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam

EL 5013 Wireless Personal Communication Systems

3 Credits The course introduces underlying principles of wireless communications and practical systems. Topics: Science and technology including radio signal propagation, interference-limited communications, multiple access, radio resources management and mobility management. Building blocks of wireless networks. Essential functions of cellular telephone systems and wireless local area networks. Details of the most important technologies including GSM, CDMA, wideband CDMA and WiFi (IEEE802.11).

Prerequisite(s): EE 3404 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5023 Wireless Information Systems Laboratory I

3 Credits This course includes hands-on experience with a combination of laboratory experiments, lectures and projects relating to spread spectrum code division multiple access (CDMA) wireless communication systems. Specific topics include pseudo-noise code generation, transmitters and receivers for direct sequence and frequency hopping systems, acquisition and tracking, CDMA wireless computer communications, UHF channel propagation characteristics including multipath time delay profiles and attenuation measurements, bit error rate measurements, phase locked loops and spectrum sharing with existing narrowband users.

Prerequisite(s): Graduate status or EE 3404.
Also listed under: EE 4183.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

EL 5033 Wireless Information Systems Laboratory II
EL 5123 Image Processing

3 Credits The course focuses on image formation and perception; image acquisition, representation and display; image sampling and resizing; contrast enhancement; two-dimensional Fourier transform and other unitary transforms; frequency domain and spatial domain linear filtering; median and morphological filtering; image smoothing, sharpening and edge detection through linear and nonlinear filtering; color image representation and processing; lossless and lossy image coding techniques and standards; image deblurring; imaging geometry, image registration and geometric transformation. Students also learn to implement selected imaging processing algorithms in MATLAB or C-language.

Prerequisite(s): Graduate student status or EE 3054 and MA 3012. Also listed under: BE 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5143 Multimedia Laboratory

3 Credits This course provides hands-on experience in processing and communication of speech, audio, image and video signals. Topics include sampling and quantization, sampling rate conversion, lossless and lossy compression, basic techniques in speech, audio, image and video coding, multimedia conferencing, video on-demand, video multicasting, multimedia document creation. Students are exposed to popular software and hardware for multimedia signal processing and document creation. Each week includes a lecture and a lab.

Prerequisite(s): Graduate status or EE 3054 or equivalent. Also listed under: EE 4153.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

EL 5213 Introduction to Systems Engineering

3 Credits This course introduces fundamentals of systems engineering process. Topics: Multidisciplinary systems methodology, design and analysis of complex systems. Brief history of systems engineering. Mathematical models. Objective functions and constraints. Optimization tools. Topics to be covered include identification, problem definition, synthesis, analysis and evaluation activities during conceptual and preliminary system design phases. Decision analysis and utility theory. Information flow analysis in organizations. Elements of systems management, including decision styles, human information processing, organizational decision processes and information system design for planning and decision support. Basic economic modeling and analysis. Requirements development, life-cycle costing, scheduling and risk analysis. Application of computer-aided systems engineering (CASE) tools.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 5223 Sensor Based Robotics

3 Credits The course covers robot mechanisms, robot arm kinematics (direct and inverse kinematics), robot arm dynamics (Euler-Lagrange, Newton-Euler and Hamiltonian Formulations), six degree-of-freedom rigid body kinematics and dynamics, quaternion, nonholonomic systems, trajectory planning, various sensors and actuators for robotic applications, end-effector mechanisms, force and moment analysis, introduction to control of robotic manipulators.

Prerequisite(s): Graduate status. Corequisite(s): EE 3064. Pre/Co-requisite: EE 3064.
Also listed under: ME 6613.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5253 Applied Matrix Theory

Prerequisite(s): Graduate status, MA 2012, MA 2132, MA 2112 and MA 2122.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5363 Principles of Communication Networks

3 Credits This course covers all fundamental aspects of communications networks. Topics are: protocol architecture, data transmission and signal encoding, multiplexing, spread spectrum, data link control, local area networks, wireless LAN, circuit switching, packet switching, routing, traffic control, Internet protocol, transport layer protocol, application design and the basics of network security.

Prerequisite(s): MA 3012 or instructor’s permission.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5373 Internet Architecture and Protocols

3 Credits This course introduces basic local area networking technologies and protocols in a set of lectures and laboratory experiments. Topics: link level protocols. Local area networks: CSMA/CD, Token Ring, IEEE standards and protocols. The Internet protocol suite: IP, ARP, RARP, ICMP, UDP and TCP. LAN Interconnection: bridges, routers and gateways. Application protocols: SNMP, FTP, SMTP and NFS.

Prerequisite(s): EL 5363 or EE 136.
Also listed under: EE 4173.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 5463 Introduction to RF/Microwave Integrated Circuits

Prerequisite(s): EE 3604.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5473 Introduction to VLSI System Design

3 Credits This course covers CMOS processing technology, MOS transistor theory, static/dynamic circuit and logic design techniques, circuit performance estimation, standard cells and gate arrays, clocking strategies, input/output structures, data path, memory and control logic design. Advanced VLSI CAD tools are used for schematic capture, layout, timing analysis and simulations for functionality and performance.

Prerequisite(s): Senior or graduate status, CS 2204 and EE 3114 or equivalent.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5483 Real Time Embedded Systems

3 Credits This course provides an overview of the unique concepts and techniques needed to design and implement computer systems having realtime response requirements in an embedded environment. It contrasts the concepts and techniques of real time and embedded systems with those of more traditional computer systems. Topics include: Basic concepts of real time and embedded systems, hardware features, programming languages, real time operating systems, synchronization techniques, performance optimization and current trends in real time and embedded systems such as incorporating internet connectivity.

Prerequisite(s): Knowledge of C, Pascal or other programming language and a basic understanding of computer architecture.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5493 Advanced Hardware Design

3 Credits This course shows how a hardware-description language (for example, VHDL) can be used for computer hardware modeling, logic synthesis, register-level synthesis and simulation. The resulting design with hundreds or thousands of gates is then ready to be downloaded to form FPGA chips or silicon cells. Programs used: QuickVHDL, modeling and simulation tools from Mentor Graphics or similar large-scale programs. A design project is required and students make a written and oral presentation.
Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5513 Electro-Optics I

3 Credits This course describes the phenomena of and introduces the analyzing techniques for wave propagation in optical systems. Topics include: Review of Maxwell equations; propagation of plane waves: polarization, reflection, refraction, interfaces and multilayers; Fourier optics and diffraction; Ray and Gaussian beams; Optical cavities; Guided optical beams, optical fibers and guiding layers; Dispersion and mode distortion in fibers.

Prerequisite(s): Graduate status, EE 3604 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5523 Electro-Optics II

3 Credits This course focuses on active optical systems. Topics include: resonant optical cavities; laser oscillation and amplification; general characteristics of lasers, laser excitation; semiconductor lasers; detection of optical radiation.

Prerequisite(s): EL 5513.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5533 Physics of Nanoelectronics

3 Credits The course covers limits to the ongoing miniaturization (Moore’s Law) of the successful silicon device technology imposed by physical limitations of energy dissipation, quantum tunneling and discrete quantum electron states. Topics: quantum physical concepts and elementary Schrodinger theory. Conductance quantum and magnetic flux quantum. Alternative physical concepts for devices of size scales of 1 to 10 nanometers, emphasizing role of power dissipation. Tunnel diode, resonant tunnel diode, electron wave transistor; spin valve, tunnel valve, magnetic disk and random access memory; single electron transistor, molecular crossbar latch, quantum cellular automata including molecular and magnetic realizations. Josephson junction and rapid single flux quantum’ computation. Photo- and x-ray lithographic patterning, electron beam patterning, scanning probe microscopes for observation and for fabrication; cantilever array as dense memory, use of carbon nano tubes and of DNA and related biological elements as building blocks and in self-assembly strategies.

Prerequisite(s): PH 2033.
Also listed under: PH 5493.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5553 Physics of Quantum Computing

3 Credits The course focuses on limits to the performance of binary computers, traveling salesman and factorization problems, security of encryption. Topics: the concept of the quantum computer based on linear superposition of basis states. The information content of the qubit. Algorithmic improvements enabled in the hypothetical quantum computer. Isolated two-level quantum systems, the principle of linear superposition as well established. Coherence as a limit on quantum computer realization. Introduction of concepts underlying present approaches to realizing qubits (singly and in interaction) based on physical systems.
The systems under consideration are based on light photons in fiber optic systems; electron charges in double well potentials, analogous to the hydrogen molecular ion; nuclear spins manipulated via the electron nuclear spin interaction and systems of ions such as Be and Cd which are trapped in linear arrays using methods of ultra-high vacuum, radiofrequency trapping and laser-based cooling and manipulation of atomic states. Included: summary and comparison of the several approaches.

Prerequisite(s): PH 2033.

Also listed under: PH 5553.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5613 Introduction to Electric Power Systems

3 Credits The course focuses on basic concepts in electric power systems. Topics: single-and-three-phase circuits, power triangle; transmission lines parameters: resistance, inductance, capacitance, transformers and generators; lumped component piequivalent circuit representation; perunit normalization; symmetrical phase components; load-flow program.

Prerequisite(s): EE 2024 or equivalent.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5623 Finite Elements for Electrical Engineering

3 Credits This course introduces the finite elements method for solving electrical engineering problems. Topics: a refresher of basic concepts of electromagnetism. Introduction to the solution methods of partial differential equations. Comparative summary of the solution methods for Maxwell equations. Finite elements, Garlekin and least squares approaches. Description of some commercial software packages. In this hands-on course, students do assignments and final projects using the finite elements software COMSOL Multiphysics.

Prerequisite(s): Graduate status or EE 3604 and EE 3824.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5663 Physics of Alternative Energy

3 Credits This course concentrates on non-petroleum sources of energy include photovoltaic cells, photocatalytic generators of hydrogen from water and nuclear fusion reactors. Topics: advanced physics of these emerging technical areas are introduced in this course. Semiconductor junctions, optical absorption in semiconductors, photovoltaic effect. Energy conversion efficiency of the silicon solar cell. Single crystal, polycrystal and thin film types of solar cells. Excitons in bulk and in confined geometries. Excitons in energy transport within an absorbing structure. Methods of making photocatalytic surfaces and structures for water splitting. Conditions for nuclear fusion. Plasmas and plasma compression. The toroidal chamber with magnetic coils as it appears in recent designs. Nuclear fusion by laser compression (inertial fusion). Small-scale exploratory approaches to fusion based on liquid compression and electric field ionization of deuterium gas.

Prerequisite(s): PH 2033.

Also listed under: PH 5663 Physics of Alternative Energy

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 5673 Electronic Power Supplies

Prerequisite(s): EE 3824 or equivalent.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5683 Electric Drives Characteristics and Controls

3 Credits The course centers on conversion of load (resistive) torque, inertia, mass and force to a rotating shaft; acceleration and deceleration times; motor power-rating selection; thermal consideration at different duty cycles; load diagram construction; four-quadrant speed control operation for DC and AC motors; Worked examples.

Prerequisite(s): EE 3824 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5713 Microwave Engineering Laboratory/Project

3 Credits The course covers design, fabrication, testing of passive circuits (couplers and filters), active circuits (amplifier and oscillator) and antennas using printed circuits. Topics: design and stimulation using microwave CAD tools (ADS, HFSS, PCAAMT), HP-8510 automated network analyzer measurement, frequency and time domain measurement, printed circuit layout and photo etching.

Prerequisite(s): EE 3604. Corequisite(s): EL 5733 or EL 6713.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

EL 5733 RF and Microwave Systems Engineering

Prerequisite(s): Graduate status or EE 3604.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5753 Introduction to Plasma Engineering
3 Credits The course focuses on basic plasma concepts and applications; parameters describing the plasma; motion of charged particles in electromagnetic fields; effect of particle collisions on plasma transport: diffusion and mobilities. Plasmas as dielectric media; plasma dielectric response functions for collective plasma oscillations and for electromagnetic wave propagation in plasma. Plasmas for practical applications.

Prerequisite(s): Graduate status or EE 3604.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5813 Biomedical Instrumentation

3 Credits This course gives an overview on the theory, design and application of biomedical instrumentation used for diagnosis, monitoring, treatment and scientific study of physiological systems. The objective of this course is to enable students to design, build and test useful circuits, and to interface them with a computer using a data acquisition system for further signal analysis and processing.

Prerequisite(s): A course in circuits including Op-Amps (eg. EE 2024) and programming experience.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 5823 Medical Imaging I

3 Credits This course introduces the physics, instrumentation and signal processing methods used in X-ray imaging (projection radiography), X-ray computed tomography, nuclear medicine (SPECT/PET), ultrasound imaging, magnetic resonance imaging and optical imaging. Co-listed with BE 6203

Prerequisite(s): Undergraduate level courses in multivariable calculus (MA 2112, MA 2122), physics (PH 2033), probability (MA 3012), signals and systems (EE 3054). Students who do not have prior courses in signals ans systems must take EL/6113/BE6403 SIGNALS, SYSTEMS AND TRANSFORMS as a prerequisite or must obtain instructor's approval; EL5123/BE6223 IMAGE PROCESSING is also recommended but not required.
Also listed under: BE 6203.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6013 Principles of Digital Communications: Modulation and Coding

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6023 Wireless Communications: Channel Modeling and Receiver Design
The course focuses on wireless communication channel models and practical techniques for mitigating transmission impairments. Topics: Channel Modeling Parameters: Path loss; Fading: long-term vs. short-term fading, flat vs. frequency selective fading and slow vs. fast fading; Multipath spread parameters: delay spread, angular spread and Doppler spread, Matrix Channel Modeling for Multiple Input and Multiple Output (MIMO) Systems. Channel Parameter Estimation: training sequence and blind approaches. Mitigation: Mitigation of path loss and fading: Diversity, handoff and power control; Mitigation of intersymbol interference: rake receiver and equalizer; Mitigation of time variation: pilot symbols and dynamic tracking. Processing Techniques: LS, zero forcing, MMSE, LMS, etc.

Prerequisite(s): Graduate status or EE 3404, MA 3012.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6033 Modern Wireless Communication Techniques and Systems**

3 Credits The course covers Multiple Access and Multiplexing Techniques; Spread spectrum and Code division multiple access (CDMA) techniques: Direct sequence, Frequency hopping; Multicarrier Techniques: Orthogonal frequency division (OFDM) and Multicarrier CDMA (MC-CDMA); New Wireless Communication Systems: Ultra Wideband communications, Wireless Fidelity (Wi-Fi), Radio Frequency Identification (RFID), Bluetooth, etc.

Prerequisite(s): EE 3404 and EL 6303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6063 Information Theory**

Prerequisite(s): Graduate status and EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6073 Error Control Coding**

3 Credits The course covers the following topics: The general theory of linear codes. Galois fields. Coding and error correction methods. Linear block codes. Convolutional codes. Parallel and serial concatenated codes. Iterative decoding algorithms. Low density parity check codes.

Prerequisite(s): EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6113 Signals, Systems and Transforms**

Prerequisite(s): Graduate status.
Also listed under: BE 6403.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6123 Video Processing

3 Credits This course covers Fourier analysis of video signals, properties of the human visual system, video signal sampling and sampling rate conversion, motion modeling and estimation, video compression techniques and standards, stereo video processing and compression, error control in networked video applications, analog and digital video systems. Students will learn to implement selected algorithms in MATLAB or C-language. A course-project is required.

Prerequisite(s): EL 5123 or EL 5143 and EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6183 Digital Signal Processing Laboratory

3 Credits This course includes hands-on experience with a set of laboratory experiments, lectures and projects relating to real-time digital signal processing (DSP) using a DSP microprocessor. Students gain experience in the implementation of common algorithms used in a variety of applications and learn tools and functions important for the design of DSP-based systems. Students are required to complete a project and give an oral presentation. This course is suitable for students interested in DSP and Embedded Systems.

Prerequisite(s): EL 6113 or equivalent, C/C++.
Also listed under: BE 6483.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 4.5 | Weekly Recitation Hours: 0

EL 6213 System Modeling, Analysis and Design

3 Credits Introduction of basic system concepts such as system state, inputs, outputs and disturbances. Modeling methods and Computer Aided Systems Engineering (CASE) formal structures. CASE tools for solving practical systems related problems. Quantitative techniques including linear programming, network flow analysis, integer and nonlinear programming, Petri nets, basic probabilistic and stochastic tools, Markov processes, queueing theory and Monte Carlo techniques for simulation. Fundamentals of decision and risk analysis.

Prerequisite(s): EL 5213. Corequisite(s): EL 6303 recommended.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 6223 Nonlinear and Sampled-Data Control Systems

Prerequisite(s): Graduate status and EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6233 System Optimization Method

3 Credits Formulations of system optimization problems. Elements of functional analysis applied to system optimization. Local and global system optimization with and without constraints. Variational methods, calculus of variations, and linear, nonlinear and dynamic programming iterative methods. Examples and applications. Newton and Lagrange multiplier algorithms, convergence analysis.

Prerequisite(s): Graduate status and EL 5253 or EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6243 System Theory and Feedback Control

3 Credits Design of single-input-output and multivariable systems in frequency domain. Stability of interconnected systems from component transfer functions. Parameterization of stabilizing controllers. Introduction to optimization (Wiener-Hopf design).

Prerequisite(s): Graduate status and EE 3064.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6253 Linear Systems

3 Credits Basic system concepts. Equations describing continuous and discrete-time linear systems. Time domain analysis, state variables, transition matrix and impulsive response. Transform methods. Time-variable systems. Controllability, observability and stability. SISO pole placement, observer design. Sampled data systems.

Prerequisite(s): Graduate status and EE 3054 or EL 5253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6303 Probability Theory

Prerequisite(s): Graduate status and MA 3012.
Also listed under: BE 6453.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6313 Stochastic Processes

Prerequisite(s): EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6323 Introduction to Wireless Networking

3 Credits An introductory, systems-level approach to wireless networks covering both physical-layer aspects of wireless communications as well as implications in the medium access control (MAC), networking and application layers. Topics include channel and rate modeling, interference and spatial reuse, auto repeat request (ARQ), quality of service, random access, scheduling, mobility and intermittent communication. Overviews and examples from state-of-the-art cellular and wireless local area networks (LAN) standards as well as modern multimedia and web applications will be provided. The course is designed as a first course in wireless networks for students both intending to specialize in wireless communications as well as students who are interested in the consequences of wireless communications in other areas including multimedia delivery, networking and mobile applications.

Prerequisite(s): Prerequisite: EL 5363 or equivalent

EL 6333 Detection and Estimation Theory

3 Credits Detection Theory: Binary Hypothesis Testing; Bayes’ Criteria; Likelihood Ratio Test; minmax test; Neyman-Pearson Tests; Receiver Operating Characteristics. Parameter Estimation Theory: Random parameter Estimation; Bayes’ Procedure; Minimum Mean Square Error (MMSE) Estimator; Maximum A-Posteriori (MAP) Estimator. Nonrandom Parameter Estimation: MAP Estimator; Unbiased Estimators and Cramer-Rao(C-R) Bound; Higher Order Bhattacharya Bounds. Uniformly Minimum
Variance Unbiased Estimators (UMVUE); Sufficient Statistic; Factorization Theorem; Rao-Blackwell Theorem. Multi-Parameter Estimation; Fisher Information Matrix. Composite Hypothesis Testing; Series Representation of Stochastic Processes with Rational spectra; Detection of distinct signals in white noise and colored noise; Mary Detection and Estimation of signals in white noise and colored noise. Blind Channel Identification. Elements of signal design for white Gaussian noise. Mary waveform design for two-dimensional signals.

Prerequisite(s): Graduate status and EL 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6373 Local and Metropolitan Area Networks**

*3 Credits* This course introduces students to fundamental design issues in wireless and wired local and metropolitan area networks, explains the state-of-the-art solutions proposed and deployed in the field by using latest standards and protocols as examples, and discusses trends in the wireless/wired LAN/MANs. Example wireless technologies covered include the IEEE 802 family of protocols, e.g., WiFi, WiMax and Bluetooth. Example wireline technologies include those associated with Ethernet and MAN technologies such as Resilient Packet Ring.

Prerequisite(s): EL 5363 or EE 136 or instructor’s permission.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6383 High-Speed Networks**

*3 Credits* This course covers the basics, architectures, protocols and technologies for high-speed networks. Topics: synchronous optical network (SONET), asynchronous transfer mode (ATM), ATM adaptation layer (AAL), 10/100/1000/10G Ethernet, Ethernet over SONET (EOS), quality of service control, packet scheduling, network processor, buffer management, flow and congestion control, TCP, high-speed TCP and XCP, Routing and IP fast rerouting, WDM networks, MPLS and GMPLS. Each student is required to complete a project that can be reading, software design or hardware design.

Prerequisite(s): Graduate status, EL 5363 or EE 136 or equivalent.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 6393 Advanced Network Security**

*3 Credits* While the recent proliferation of broadband wire-line and wireless networking technologies have substantially increased the available network capacity and enabled a wide-range of feature-rich high-speed communication services, security remains a major concern. Network attacks have become common recurring events that increasingly threaten the proper functioning and continual success of the communication infrastructure and services. One way to mitigate such threats is to develop new security/defense architectures, systems, methodologies and algorithms that can scale together with the communications infrastructure in terms of operating speed, operational simplicity and manageability. This course aims to understand the theoretical, architectural, system and implementation issues related to all aspects of security in high-speed networks and study various proposed solutions. Students are required to read research papers and complete a term project with either simulation programs to evaluate the proposed schemes, or architecture/VHDL designs for the schemes.
EL 6413 Analog and High Frequency Amplifier Design

Prerequisite(s): Graduate student status or EE 3114 and EE 3124.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6423 RF Electronics for Wireless Applications

3 Credits Tuned circuits and impedance transformers, narrowband nonlinear amplifiers. Tuned circuit sine wave oscillators, mixers, AM modulators and demodulators, FM modulators and demodulators and the phase-locked loop.

Prerequisite(s): EL 6413.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6433 Digital Integrated Circuit Design

Prerequisite(s): EL 6413.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6443 VLSI System and Architecture Design

3 Credits This course continues from EL 5473 and covers top-down VLSI design using VHDL including structural design, modeling, algorithmic and register level design, synthesis, prototyping and implementation using FPGAs and methods to design for test (DFT). This course provides a solid background and hands-on experiences with the CMOS VLSI design process in which
custom design techniques (covered in EL 5473) are married with HDL synthesis to produce complex systems. Students complete a project covering design partitioning, placement and routing, automated synthesis and standard cell design and use. The course explores how these techniques are used in designing ASICs, System-on-Chips (SoC) and advanced microprocessors.

Prerequisite(s): EL 5473.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6493 Design and Test of Digital Systems

3 Credits Logic simulation methods, structural hazards; Manufacturing test fundamentals, fault modeling and simulation, automatic test pattern generation algorithms; Enhancing testability of digital systems: Design for testability; Advanced testing techniques: Test data compaction and compression techniques; Integrated circuits vs System-on-A-Chip (SOC) design styles and their manufacturing test implications.

EL 6553 Quantum Mechanics I

3 Credits Quantum mechanics with applications to atomic systems. The use of Schrodinger’s equations. Angular momentum and spin. Semi-classical theory of field-matter interaction.

Prerequisite(s): MA 2122 and PH 3234 or equivalents.  
Also listed under: PH 6673.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6583 Fiber Optic Communications

3 Credits This course deals with the operating principles of optical communications systems and fiber-optic communication technology. The main elements of systems are presented in block diagrams and discussed individually. The advantages and disadvantages and the applications of Fiber Optic Communications Systems are discussed. Topics include: overview of optical communication systems, review of optics, review of analog and digital communications, the characteristics of optical fibers, optical waveguides, optical sources and transmitters, optical detectors and receivers, optical amplifiers, noise and detection, impairment in optical communication systems and optical network design issues. Upon completion of this course, students are familiar with the principles and technology of optical communication systems, and are able to design a simple point-to-point optical communications link, including bandwidth, loss, signal to noise ratio (S/N) and bit error rate considerations.

Prerequisite(s): Graduate status or EE 3604.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6603 Power Electronics

3 Credits The course centers on principles of thyristor devices, GTOs, MOSFETs, IGBTs; dynamic characteristics of DC/DC converters; forced commutation circuits; switched-mode power supplies; full- wave and half-wave rectifiers; phase controlled converters; effect of the load characteristics; pulse-width modulated inverters.
Prerequisite(s): Graduate status and EE 3824 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6623 Power Systems Economics and Planning

3 Credits Power-system economics: revenue requirements, load duration and reserve requirements. Load forecasting: econometric methods. Optimal expansion planning and methodologies: optimal generation expansion computer modeling. Decision analysis techniques. Deregulation of electric power industry.

Prerequisite(s): Graduate status and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6633 Transients, Surges and Faults in Power Systems

3 Credits Analysis of lumped-circuit, normal and abnormal transients in power equipment and systems. Short-circuit fault analysis and transient recovery of three-phase circuits. Analysis of traveling-wave surges on transmission lines, windings and integrated systems.

Prerequisite(s): Graduate status and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6643 Relay Fault Protection

3 Credits Protective relay functions and classification. Electromechanical relay types, operating principles and basic characteristics. Communication channels for relaying. Current and voltage transformers, transducers. Protection of busses, transformers, generators, motors and other station equipment by the zone protection method. Distribution and transmission line relaying systems. Relay setting calculations. Primary and backup protection, application and philosophy with applied relay engineering examples.

Prerequisite(s): Graduate status and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6653 Power System Stability

3 Credits The course introduces power-system dynamics: mathematical modeling of prime movers, power plants, synchronous machines, field exciters transmission lines, relay loads and stabilizers.

Prerequisite(s): Graduate status, EE 3824 and EL 5613.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6663 Distributed Generation Systems
3 Credits Benefits and limitations and classification of small generating systems; principles of operation and electrical equivalent circuits of fuel cells, solar cells, micro-turbines, reciprocating engines, wind turbines and gas turbines; fault conditions; reactive power support; power quality issues.

Prerequisite(s): EE 3824 and EL 5613 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6683 Adjustable Speed Drives

3 Credits Engineers universally recognize that electric drives offer enormous potential for energy conservation. Factory automation, transportation (all-electric and hybrid-electric vehicles) and a trend to replace hydraulic drives by electric ones has driven interest among employers and students for education based on solid theoretical foundations. The course requires only a basic undergraduate preparation in circuits, electromagnetics and energy. Advanced topics of special electric machinery and control methods are introduced on in-time basis. This course complements EL 5683, which covers electromechanical aspects of electric drives, and EL 6603, which covers on AC-DC and DC-AC conversion for drives and utility applications.

Prerequisite(s): Graduate status and EE 3824 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6713 Electromagnetic Theory and Applications

3 Credits This course introduces Maxwell’s equations, wave equation, vector potentials, boundary conditions and Poynting vector. Time-harmonic fields and phasor approach are introduced. The properties of freely propagating plane waves in uniform and layered media are derived, as well as waves guided by structures, including various transmission lines, hollow waveguides and dielectric waveguides. A unified treatment of wave propagation is given with general theorems and examples drawn from microwaves, integrated circuits and optics.

Prerequisite(s): Graduate status and EE 3604.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6723 Electromagnetic Radiation and Antennas

3 Credits The electromagnetic fields radiated by current elements are derived from Maxwell’s equations. From these results, the fields radiated by many types of antennas are derived, including various types of dipoles, arrays, aperture, and frequency independent and traveling wave antennas. Concepts introduced include radiation resistance and pattern, directivity, gain, effective area, reciprocity, bandwidth, noise temperature, mutual coupling and array scanning impedance.

Prerequisite(s): Graduate status and EL 6713, or EE 3604 with grade B or better.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6753 UHF Propagation for Wireless Systems

3 Credits The course examines UHF radio applications for cellular mobile radio telephones, wireless local area networks and personal communications networks, propagation and reflection of plane waves and spherical waves; antennas for transmitting and
Prerequisite(s): Graduate status and undergraduate electromagnetic course.  
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 6823 Medical Imaging II

3 Credits This course introduces mechanisms and concepts related to image acquisition, subsequent image processing and image formation in various biomedical imaging modalities. Building on material covered in EL 5823/BE 6203 -Medical Imaging I, this course focuses on advanced topics such as functional magnetic resonance imaging (MRI), ultrasound imaging, biomagnetic imaging and optical tomographic imaging.

Prerequisite(s): EL 5823/BE 6203.  
Also listed under: BE 6213.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7023 Space-Time Wireless Communications

3 Credits The course provides an introduction to Multiple-Input Multiple-Output (MIMO) wireless communication systems. MIMO system capacity, MIMO system design criteria. Spacetime block and trellis codes. Spatial multiplexing and receiver design. Applications to MIMO OFDM systems.

Prerequisite(s): EL 6303. Corequisite(s): EL 6013 or EL 6023.  
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7133 Digital Signal Processing

Prerequisite(s): EL 6113 or equivalent.  
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7153 Array Signal Processing

Prerequisite(s): Graduate status, EL 6113 and EL 6313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7163 Wavelet Transforms and Filter Banks

3 Credits Orthogonal and biorthogonal wavelet bases on the real line. Scaling functions and the dilation equation. Construction of Daubechies wavelet bases. Mallat’s algorithm. Digital filter banks and the discrete wavelet transform. Two-dimensional wavelet transform and applications to image processing. Wavelet-based noise reduction. Lattice and lifting structures for implementation of filter banks. Expansive (over-complete) transforms. Additional applications. Students are required to complete a project and give an oral presentation. Regular computer-based exercises are given.

Prerequisite(s): EL 7133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7253 State Space Design for Linear Control Systems

3 Credits Topics covered in this course include canonical forms; control system design objectives; feedback system design by MIMO pole placement; MIMO linear observers; the separation principle; linear quadratic optimum control; random processes; Kalman filters as optimum observers; the separation theorem; LQG; Sampled-data systems; microprocessor-based digital control; robust control and the servocompensator problem.

Prerequisite(s): Graduate status and EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7353 Communication Networks I: Analysis, Modeling and Performance

3 Credits The course introduces the analytical techniques used in the design and performance analysis of networks. Building on their knowledge of networking technology and applied mathematics, especially probability, students learn basic queuing theory, to be applied to performance analysis of multiplexers, switches and multiple access networks. Newer techniques such as the network calculus, the study of non-Poissonian long range dependent traffic sources and applications to TCP, admission control, advanced packet switches and IEEE 802.11 networks are introduced.

Prerequisite(s): EL 5363 and EL 6303.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 7363 Communications Networks II: Design and Algorithms

3 Credits The course covers network design, which consists of topology design and traffic routing taking into account dynamics in network states, such as link/node failures and traffic demand variations. Efficient design models and optimization methods are crucial to simultaneously achieve good network user performance and high savings in network deployment and maintenance. This course introduces mathematical models, design problems and optimization algorithms that can be used to guide network design practice. Subjects include: Network Design Problem Modeling, Optimization Methods, Multi-Commodity Flow Routing, Location and Topological Design, Fair Networks, Resilient Network Design, Robust Network Design, Multi-Layer Networks.

Prerequisite(s): Graduate status, EL 5363 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 7373 High Performance Switches and Routers

3 Credits This course addresses the basics, the theory, architectures and technologies to implement high-performance high-speed large-scale routers and switches. The fundamental concepts and technologies of packet forwarding, classification and switching learned in the class are useful and practical when designing IP routers, Ethernet switches and optical switches. Topics: IP Route Lookup, Packet Classification, Packet Scheduling, Buffer Management, Basics of Packet Switching, Output-buffered Switches, Shared-memory Switches, Crosspoint-buffered Switches, Input-buffered Switches, Clos-network Switches, Multi-Stage Buffered Switches, Two-Stage Load-Balanced Switches, Optical Packet Switches and ASIC for IP Routers.

Prerequisite(s): EL 5363 or adviser approval.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 8223 Applied Nonlinear Control

3 Credits Stability and stabilization for nonlinear systems; Lyapunov stability and functions, input-output stability and control Lyapunov functions. Differential geometric approaches for analysis and control of nonlinear systems: controllability, observability, feedback linearization, normal form, inverse dynamics, stabilization, tracking and disturbance attenuation. Analytical approaches: recursive back stepping, input-to-state stability, nonlinear small-gain methods and passivity. Output feedback designs. Various application examples for nonlinear systems including robotic and communication systems.

Prerequisite(s): Graduate status and EL 6253 or EL 7253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 8233 Optimal Control Theory

3 Credits This course focuses on optimal control problem for deterministic systems with various constraints. Topics: solution for both continuous and discrete-time systems using the maximum principle and dynamic programming. Singular arcs. Neighboringoptimal solutions. Fuel and time optimal control problems. Computational methods.

Prerequisite(s): Graduate status, EL 6233 and EL 6253.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
EL 8253 Large-Scale Systems and Decentralized Control

3 Credits This course introduces analysis and synthesis of large-scale systems. Topics: system order reduction algorithms, interconnected system stability, series expansion and singular perturbation. Lyapunov designs. Applications to traffic networks, power systems and transportation networks. Decentralized control: decentralized fixed-mode, LQR, frequency-shaped cost functional and overlapping decompositions. Stability of interconnected systems and Vector Lyapunov analysis.

Prerequisite(s): Graduate status and EL 7253 or instructor’s permission.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 9900 Seminar in Electrical and Computer Engineering

0 Credits This course consists of seminar presentations on recent developments in electrical and computer engineering by speakers from industry, research and education institutions. To receive a satisfactory grade, a student must attend at least two thirds of the seminars during the semester registered. A PhD student must register and obtain satisfactory grade for at least four semesters.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 9920 Summer Graduate Internship

0 Credits This course provides graduate students majoring in electrical engineering, computer engineering, electrophysics, systems engineering, telecommunication networks or wireless innovation the opportunity to gain practical training off campus. Such training will enhance and strengthen the students overall educational experience by obtaining practical experience in currently active areas in industry.

Note: Adviser approval is required.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 9933 Readings in Electrical and Computer Engineering I

3 Credits This course requires a student to read advanced literature in a research field relevant to electrical and computer engineering, under guidance of a faculty member who is expert in the field. Oral presentation and a written report is required. Not more than 3 credits may be taken toward the master’s degree. A student must secure a project adviser before registration.

Prerequisite(s): Degree status.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EL 9943 Readings in Electrical and Computer Engineering II

3 Credits This course requires a student to read advanced literature in a research field relevant to electrical and computer engineering, under guidance of a faculty member who is expert in the field. Oral presentation and a written report are required. No more than 3 credits may be taken toward the master’s degree. A student must secure a project adviser before registration.
**EL 9953 Advanced Projects I**

*3 Credits* This course requires a student to conduct a theoretical and/or experimental project in a research area in electrical and computer engineering. The project is chosen based on the student’s specialized interest and preparation and is guided by a faculty member who is expert in the chosen subject. Oral presentation or a written report is required at the adviser’s discretion. A student must secure a project adviser before registration.

*Prerequisite(s): Degree status.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**EL 9963 Advanced Projects II**

*3 Credits* This course requires a student to conduct a theoretical and/or experimental project in a research area in electrical and computer engineering. The project is chosen based on the student’s specialized interest and preparation and is guided by a faculty member who is expert in the chosen subject. Oral presentation or a written report is required at the adviser’s discretion. A student must secure a project adviser before registration.

*Prerequisite(s): Degree status.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**English**

**EN 1080W Introduction to College Writing for ESL Students**

*3 Credits* This intensive course in reading comprehension and composition skills is for non-native speakers of English who are inadequately prepared for college composition. The course emphasizes competency in standard written English and fluency in writing, grammatical control, comprehension of college-level texts, practice in listening and speaking and expansion of English-language skills for academic and professional purposes.

*Prerequisite(s): EN Placement exam.*
EN 2123 Technologies of Literary Production

3 Credits This course examines how the changing status and technologies of written language have shaped and continue to transform literary culture. Beginning with works first conceived and transmitted as part of rich oral traditions, the course will end with works of literature produced primarily for online readers.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H .
Note: Satisfies a humanities and social sciences elective.

EN 2133/W The Invention of the Word

3 Credits This course explores not the subject of “innovation” in literature, but the fact of it. Students read a range of literary texts that invented utterly new ways of writing: new forms and new approaches to consciousness and language itself. The course focuses on two clusters of literary and linguistic innovation: (1) writing in the ancient world, where narrative, drama and lyric—and indeed, the technology of writing itself—were first invented, and (2) works by pioneering literary modernists who radically reinvented the forms forged by their earliest predecessors.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H .
Note: Satisfies a humanities and social sciences elective.

EN 2143/W Machines Made of Words I: Poetry as Design

3 Credits Following (and challenging) William Carlos Williams’ definition of a poem as “a machine made of words,” this course examines how poems are made. The course explores questions of invention and innovation in poetic form and how “form” and “content” interact in a wide range of poetry—from the earliest English ballads to contemporary work. Students write five critical essays.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H .
Note: Satisfies a humanities and social sciences elective.

EN 2153/W Inventing America: Nation, Culture, Self

3 Credits This course explores the ways American writers have imagined—and participated in—the invention of nation, culture and self, from the Colonial period through the Civil Rights era. Special attention is paid to how American writers have engaged with questions surrounding the “newness” of American culture and how literature has reflected and affected “change” in American culture.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H .
Note: Satisfies a humanities and social sciences elective.

EN 2163 Shakespeare and the Creative Imagination

3 Credits In this course, students learn how Shakespeare’s writings were influenced by his literary forebears and how he has inspired artists since his own time. Through this approach, the course explores the author’s particular creative genius and his
EN 2173/W The World's Greatest Journeys

3 Credits In this introduction to the literature of the journey, from several countries and historical periods, the focus is on the place of science, innovation and invention in these works. This writing-intensive course emphasizes revision.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

EN 2183/W The Novella: Between the Short Story and the Novel

3 Credits This course introduces the origins, characteristics and innovative qualities of the novella from several countries and historical periods. The course compares this genre with the novel and short story. Students discuss and write about assigned works.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

EN 2193/W The Rise of the Graphic Novel

3 Credits This course explores the recent emergence of the graphic narrative as a literary genre. How has the comic book, once exclusively identified with popular culture, developed into a mode for sophisticated literary and artistic creation?

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

EN 2233W Literature and War

3 Credits This course explores how literary depictions of war have changed over time. We begin with early examples such as Virgil's "Aeneid," "Beowulf," and Shakespeare's "Henry" plays, in which war is closely identified with heroism and coming of age and move onto later examples such as Vonnegut's "Slaughterhouse-Five" and O'Brien's "The Things They Carried," in which participating in war is portrayed as a more troubling activity. In addition to literature, we will address theoretical readings on the impact of new technology on the language of war.

Prerequisite(s): Prerequisite: EN 1013 or HUSS 1023 or EW 1013 or EW 1023 or equivalent

EN 3133 Machines Made of Words II: Designing Poetry
3 Credits In this seminar/workshop, students read a wide range of poetic forms or structures and practice making poems, focusing on the reading and composition of poems as forms of design.

Prerequisite(s): EN 2143/W or permission of instructor.
Note: Satisfies a humanities and social sciences elective.

EN 4911 Special Topics in Literature

Variable Credits This course discusses variable topics in literature.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

EN 4912 Special Topics in Literature

Variable Credits This course discusses variable topics in literature.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

EN 4913 Special Topics in Literature

Variable Credits This course discusses variable topics in literature.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

EW 1013 Writing the Essay

3 Credits This is the foundational writing course. It provides instruction and practice in critical reading, creative thinking, and clear writing. It provides additional instruction in analyzing and interpreting written texts, the use of written texts as evidence, the development of ideas, and the writing of both exploratory and argumentative essays. The course stresses exploration, inquiry, reflection, analysis, revision, and collaborative learning.

EW 1023 The Advanced College Essay

3 Credits This course follows EW 1013 and provides advanced instruction in analyzing and interpreting written texts from a variety of academic disciplines, using written texts as evidence, developing ideas, and writing argumentative essays. It stresses analysis, argument, reflection, revision, and collaborative learning.

Prerequisite(s): EW 1013.
Financial Engineering

FRE 6291 Options and Derivatives

1.5 Credits This course covers basic derivatives, including futures contracts, forward contracts, option and swap contracts. The focus is on the application of these instruments by financial institutions. Basic valuation concepts and the use of derivatives for speculative purposes, hedging purposes and arbitrage are discussed, as are the specifics of the contracts and the markets in which they trade. Also discussed are financial derivatives, such as interest rate, currency and equity contracts; and commodity contracts and specialty contracts, such as insurance derivatives and credit derivatives.

Prerequisite(s): FRE 6003, FRE 6023 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Finance

FIN 2003 Economic Foundations of Finance

3 Credits This course focuses on the fundamental economic concepts underpinning modern financial theory. Material includes consumer behavior; utility theory; analysis of production and costs; competitive markets; monopolistic and monopsonistic markets; time value of money; game theoretic analysis of oligopoly; asymmetric information in markets; externalities; market efficiency and more. The calculus is used to develop these concepts.

Prerequisite(s): EW 1023 and 8 credits of calculus.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FIN 2103 Creating and Understanding Financial Statements
This course provides a solid understanding of the creation and interpretation of modern financial statements. Topics include the compelling reasons for financial statements, Sarbanes-Oxley, U.S. accounting principles and how they differ abroad, quality of financial information, financial ratios and their uses, cash-flow analysis, measurement of corporate performance, credit analysis and introduction to managing financial risk.

**Prerequisite(s):** EW 1023.
**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FIN 2203 Corporate Finance and Financial Markets

This course covers the fundamentals of corporate finance, valuation, risk, capital budgeting and market efficiency. Students who complete this class acquire a solid foundation needed for intermediate and advanced topics in finance. This class is a prerequisite for all FIN classes at the 3000 level.

**Prerequisite(s):** EW 1023 and 8 credits of calculus. **Corequisite(s):** MA 2054 or MA 2212 or MA 3012.
**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FIN 3213 Financial Management and Risk Engineering

The course introduces the elements and techniques of risk engineering spanning the following: Probabilities and their distributions and data analysis and statistics as well as Monte Carlo simulation. Throughout, these techniques are demonstrated through special problems and cases providing the necessary tools and concepts for dealing with major problems in risk engineering, decision-making under uncertainty, and financial management and pricing. The course is based on multiple sessions in a Financial Laboratory environment, using computational risk software, statistical and financial econometric software, and simulation programs and software.

**Prerequisite(s):** FIN 2203. **Corequisite(s):** FIN 2003 and FIN 2103.
**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FIN 3233 Derivatives and the Options Market

This course builds on mathematical models of bond and stock prices and covers two major areas of mathematical finance with significant impact on operating-model financial markets, namely, Black-Scholes arbitrage pricing of options, and other derivative securities and interest rates together with their term structure. The course makes significant use of probability and calculus, covering the material in a mathematically rigorous and complete manner.

**Prerequisite(s):** FIN 2203. **Corequisite(s):** FIN 2003 and FIN 2103.
**Weekly Lecture Hours:** 3 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FIN 3403 Entrepreneurship and Financial Management

This course introduces the finance of entrepreneurship and venture capital. It considers the perspectives of the start-up firm and the venture capitalist and develops a framework for understanding the laws, contracts and issues involved in reaching mutually profitable contracts.
FIN 3503 Operational Risk Modeling and Analytics

3 Credits This course focuses on how to optimize business strategies, qualitatively and quantitatively with respect to operational risk. The course is organized around the principle that operational risk analysis consists, in part, of data collection and the building of mathematical models to describe the risk of failures in human resources, processes and technology. Beginning with a foundation for operational risk modeling and a focus on the modeling process, the course discusses probabilistic tools for operational risk modeling and statistical methods to calibrate models of operational risk. The quantitative assessment of operational risk uses the tools of probability, statistics and actuarial science.

Prerequisite(s): FIN 2203. Corequisite(s): FIN 2003 and FIN 2103.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FIN 3593 Probabilistic Risk Assessment

3 Credits This undergraduate course in probabilistic risk assessment (PRA) introduces students to a deep, comprehensive methodology for risk evaluation associated with complex engineered technological designs. Four fundamental questions are addressed: what can go wrong, what are the indications of potential failure, what is the potential magnitude of the failure, and with what probability will failure occur. We will also explore human reliability analysis and common-cause-failure analysis. This course can be applied towards the requirements for NYU-Poly’s minor in Nuclear Science and Engineering but not towards the minor in Finance.

Prerequisite(s): MA 2054 or MA 2212 or MA 3012.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FIN 4903 Special Topics in Finance and Risk Engineering

3 Credits The course considers unique topics of interest in Finance and Risk Engineering. It may feature a detailed look at a single topic or a series of focused topical presentations.

Prerequisite(s): FIN 2003, FIN 2103 and FIN 2203
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Finance and Risk Management

Finance and Risk Management
FRE 5500 Bloomberg Certification

0 Credits The required Bloomberg certification is a self-taught, self-paced process available on any Bloomberg terminal. Upon completion and receipt of the certification, the student’s requirement in this area will be deemed complete. This requirement can be completed at any time prior to the end of the financial lab course, even before beginning the Master’s in Financial Engineering program if a student so chooses, but no later than the last class of the semester in which the lab course is taken.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6003 Financial Accounting

3 Credits This course provides a solid foundation in the construction and interpretation of financial statements. Topics include accounting terminology; financial statement preparation and analysis; liquidity and credit risk ratios; depreciation calculations; revenue recognition; and accrued liabilities and asset valuation. Also covered are the effects of equity transactions; cash flows; and various accounting methods on financial statements.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6021 Financial Insurance and Credit Derivatives

1.5 Credits Financial insurance and Derivatives have moved to the center of modern corporate finance, investments and the management of financial institutions. Option pricing concepts are applied to price complex structured financial products and to price portfolios of equity-linked life insurance. This course also introduces modeling and the pricing of credit derivatives such as CDOs and the many other vehicles used to securitize portfolios of MBS, Loans, etc. Applications to Fixed Income problems, interest rates and bond derivatives, the management of portfolio risks and their like are considered.

Prerequisite(s): FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6023 Economic Foundations in Finance

3 Credits This course studies the interactions between money, the financial system and the economy. Topics include supply and demand; consumer theory; theory of the firm; production costs and other subject areas such as interest rates and asset returns. This course summarizes key insights from financial economics as the methodological and conceptual basis of financial engineering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6031 Money, Banking and Financial Markets
1.5 Credits Financial econometrics has matured into an important and necessary field, providing an opportunity to deal with practical problems in finance. For example, techniques such as ARCH and GARCH and their subsequent development are used to estimate the volatility of underlying financial processes; the analysis of intra-day trading data requires particular mathematic techniques; memory-based and persistent stochastic processes can be used for algorithmic trading and detecting markets incompleteness; and copulas are now applied routinely to model and estimate dependent risks. These financial and risk problems require the application of advanced financial-econometric techniques, which the course provides from theoretical and empirical-applied viewpoints. Selected cases provide a real-world sense of financial engineering when it is faced with financial-market reality and complexity.

FRE 6041 Risk Management in the Real World

1.5 Credits The course covers failures of financial theory in risk management, deriving from fundamental definitions and assumptions in modeling, including pricing formulae; convexity; stochasticity and volatility; “fat tails”; and risk. Other topics: Portfolio robustness and extreme markets and moral hazard; datamining biases and decision error; and decision-making with incomplete information.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6051 Finance Insurance

1.5 Credits This course highlights essential facets of actuarial science, insurance and finance insurance. The course assumes that students are familiar with basic notions of expected utility and stochastic processes, and options pricing. Topics include Insurance Business and Insurance Firms Management; Principles of Actuarial Science and Risk Pricing by both actuarial (historic and data based) and financial approaches (based on implied estimates of future losses). The expected Utility Approach to Insurance Risk Pricing and Management is briefly reviewed and greater attention is given to financial insurance derivatives; pricing Insurance Products (Life Insurance, Casualty, Pension Funds and Defined Benefits). The course concludes with an appreciation of the Principles of Insurance Management in a Dynamic and Global Setting. Throughout, the course uses numerous cases centered on financial insurance and actuarial problems and analyzes them from a financial markets perspective. Particular problems such as insurance pension funds, CATBOND and weather (insurance) derivatives and regulation are presented as case problems.

Prerequisite(s): FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6071 Derivatives, Financial Markets and Technology

1.5 Credits This course covers basic derivatives, including futures contracts, forward contracts, option contracts and swap contracts. The principal focus is on the use of these instruments by financial institutions. Basic valuation concepts are discussed, as are the use of derivatives for speculation, hedging and arbitrage. The specifics of the contracts and the markets in which they trade are also discussed. The main focus gives students in the Financial Technology track a general understanding of the derivatives market and risk management.

Prerequisite(s): FRE 6003, FRE 6023 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 6083 Quantitative Methods in Finance

3 Credits This course focuses on quantitative methods and financial modeling. Probability theory, stochastic processes and optimization are studied and applied to a broad variety of financial problems and their derivatives. Topics include probability spaces; conditional probability; densities; distributions; density estimators; multivariate probability; moment generating functions; random walks; Markov processes; Poisson processes; and the Brownian-motion process.

Prerequisite(s): Students are expected to know calculus and elementary probability.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6091 Financial Econometrics

1.5 Credits This course focuses on the art and science of statistical modeling of processes applied to business, finance and economics. These may include models of aggregate economic activity, economic behavior of firm or behavior of financial assets. Topics include statistical inference; maximum likelihood estimation; method of moments; Bayesian estimation; least-squares estimation; robust estimation; kernel estimation; copula estimation; analysis of variance; linear regression models; multiple regression; logistic regression; quantile regression; time series estimation; unit root tests; bootstrapping.

Prerequisite(s): FRE 6083. Students are expected to know basic statistics.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6103 Corporate Finance

3 Credits The modern corporation, as issuer of financial securities and end-user of financial risk management products, is a major participant in financial markets and the economic counterpart to investors and financial intermediaries. The mechanism of financial markets and the valuation of instruments are studied in further detail in other courses. However, this course applies the tools of the trade of financial economics and corporate finance to the financial decision-making process of firms. Upon successful completion of this course, students know how to contribute to optimal financial decisions in a corporation: valuation; capital budgeting; risk; capital structure; dividend policy; long-term financing; risk management; and mergers and acquisitions. Increasingly important international factors that affect corporate finance are stressed throughout.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6111 Investment Banking and Brokerage

1.5 Credits This course introduces an overview of Wall Street, the back office and general brokerage operations, investment banking and capital markets. The course covers subjects essential to understanding how products, once created, are distributed and sold. The course relies heavily on The Wall Street Journal, Financial Times and other trade publications. Topics include a brief history of Wall Street, an understanding of the major securities laws and how they have changed over time, basics of equity and debt securities, creation of debt and equity securities, and pricing and sale of debt and equity securities. The course seeks to understand how and where opportunities for creating new securities arise.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 6123 Financial Risk Management and Asset Pricing

3 Credits This course introduces the techniques and problems of Financial Risk Management and Asset Pricing. It emphasizes risk finance and attitudes; Value at Risk; risk measurement principles; valuation and expected utility and their relevance in the valuation and the pricing of financial investments; insurance; management of derivatives; and risk management. Throughout, risk-management application problems are explored. The course introduces and focuses on the fundamental principles of the Arrow-Debreu state preference theory used to price derivatives and other assets in complete markets. Risk neutral-Binomial models in option pricing; essential elements of Ito calculus; and the Black-Scholes model for pricing options are introduced and applied to practical financial decision making and risk management problems.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6131 Clearing and Settlement and Operational Risk

1.5 Credits This course focuses on issues involved in processing financial transactions—from order execution to final settlement of transactions—and operational risk in general. The course examines the procedures and market conventions for processing, verifying, and confirming completed transactions; resolving conflicts; decisions involved in developing clearing operations or purchasing clearing services; the role played by clearing houses; and numerous issues associated with cross-border transactions. The course also examines the effects of transaction processing, liquidity management, organizational structure, and personnel and compliance on the nature of operational risk. Qualitative and quantitative measures of operational risk are discussed.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6143 Life Insurance and Related Financial Products

1.5 Credits This course begins with an introduction to the Mathematics of Life Insurance. Basic topics covered are survival distributions, time-of-death as a continuous random variable, life tables and their interpretation. Insurance applications include estate planning, tax ramifications and other specific issues related to the multiple uses of life insurance. Characteristics of life annuities are exhibited; the equivalence principle is introduced and used to evaluate future benefits. Prospective future loss on a contract already in force is investigated. An emphasis lies on the integration of life contingencies into a full risk-theory framework and the use of modern probabilistic and financial methods that are based on financial pricing.

Prerequisite(s): FRE 6051.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6151 Foundations of Financial Technology

1.5 Credits Every year, financial institutions spend billions to exploit the latest development in information technology. This course introduces a framework with which to understand and leverage information technology. The technology components covered include telecommunications, groupware, imaging and document processing, artificial intelligence and object-oriented analysis and design. The course also covers the entire technological-planning process specifically for financial institutions.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 6163 Life Contingencies II

3 Credits The course investigates annuity and insurance contracts involving two lives. Subsequently, a more realistic model is introduced in which several causes of decrement are possible. An overview of risk-theory application to insurance is given. Also covered are an extension of the individual model to incorporate operational constraints such as acquisitions and administrative expenses, accounting requirements and the effects of contract termination.

Prerequisite(s): FRE 6143.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6171 Management of Financial Institutions

1.5 Credits This course focuses on managing institutions from a financial-management perspective. By analyzing the factors that define the dynamics of the rapidly changing financial services industry, the course explores the normative consequences of financial management decision-making to create shareholder value.

Prerequisite(s): FRE 6031 and FRE 6023.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6191 Advanced Topics in Financial Technology

1.5 Credits This course complements the Foundations of Financial Technology by treating in-depth advanced topics in this rapidly changing field. Students prepare and present case studies applying the concepts covered in class.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6211 Financial Market Regulation

1.5 Credits This course considers the role and forms of regulation in the U.S. financial markets, the role of the Securities and Exchange Commission (SEC), the Commodity Futures Trading Commission (CFTC), the Federal Reserve, the Office of the Controller of the Currency (OCC), and self-regulating organizations (SROs) such as the National Association of Securities Dealers and the National Futures Association. Also examined are the roles of the state insurance commissions and the state or federal Department of Labor.

Prerequisite(s): FRE 6031.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6223 Credit Risk and Actuarial Models

3 Credits Many problems in actuarial science involve building a mathematical model to forecast or predict future insurance losses and revenues. Historical data guide the actuary in selecting the model and in calibrating its unknown parameters. The course introduces discrete and continuous actuarial models such as loss, frequency and severity models and their specific characteristics. It then studies aggregate loss models in which individual risks are pooled into a manageable aggregate risk. Finally, financial
tools are used to market price theses losses and allow a securitization of insurance firms’ portfolios.

Prerequisite(s): FRE 6051 Insurance Finance and Actuarial Science.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6231 Stochastic Calculus and Financial Modeling

1.5 Credits This course extends the core course FE6083 to Stochastic Calculus in Finance, emphasizing the modeling approach and resolution of important problems in derivatives finance, in pricing assets and complex financial products. In addition, cases highlighting the impact of theoretical finance on market trading, investment and portfolio management and related problems are emphasized. Some of the techniques used include Markov chains, random walks, stochastic differential equations and Ito Calculus, optimal stochastic control and stochastic dynamic programming as well as Monte Carlo simulation. These techniques are applied to selected financial engineering models to assess and simulate (using MATLAB and other software) essential derivative and related problems of practical importance in finance.

Prerequisite(s): FRE 6083.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6243 Credibility and Loss

3 Credits This course deals with actuarial models and the estimation of their parameters. Statistical parameter estimation techniques and Bayesian methods are used to study and interpret survival models. Quantitative methods for model selection and model testing are introduced. The basics of credibility theory provide the mathematical tools for an insurer’s prospective experience rating on a risk or a group of risks (e.g., to justify policy prices). Finally, model simulation techniques are treated in theory and practice.

Prerequisite(s): FRE 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6251 Numerical and Simulation Techniques in Finance

1.5 Credits The course presents advanced numerical techniques to solve ordinary, partial and stochastic differential equations. These techniques are analyzed mathematically and use computer aided software that allows for the solution and the handling of such problems. In addition, the course introduces techniques for Monte Carlo simulation techniques and their use to deal with theoretically complex financial products in a tractable and practical manner. Both self-writing of software as well as using outstanding computer programs routinely employed in financial and insurance industries will be used.

Prerequisite(s): FRE 6083.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6271 Valuation of Equity Securities and Financial Statement Analysis

1.5 Credits This course examines in detail the tools and techniques for analyzing financial statements for purposes of credit evaluation, forecasting, identifying merger candidates, enhancing the efficiency of decision making and diagnosing problem
areas in the firm before crises develop. Students learn to use financial ratios to conduct duPont (i.e., decomposition) analysis, a methodology to discover sources of poor performance through interrelationships among a firm’s financial ratios.

Prerequisite(s): FRE 6003 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6291 Applied Derivative Contracts

1.5 Credits This course provides an introduction to derivative contracts with a special emphasis on current practical applications in use today by financial institutions for investing, hedging, trading and issuing. The characteristics and features of futures, forwards, swaps, options and structured notes are all covered with a special emphasis on useful applications. For each of the four primary derivative contracts, we review in these lectures the appropriate definitions, terminology, market mechanics and theoretical fair value pricing.

Prerequisite(s): FRE 6003, FRE 6023, FRE 6103 and graduate standing
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6311 Dynamic Assets and Option Pricing

1.5 Credits The course focuses on inter-temporal assets pricing, both in discrete and continuous time. The course distinguishes between problems in complete and incomplete markets of both theoretical and practical interest, all of which requires an appreciation of financial economic theories and computational techniques. Problems and cases are presented that span Fixed Income (Bonds), Stocks and Derivatives (Options of various sorts), and Implied Risk Neutral Pricing. Reference text: Applied Stochastic Models and Control for Finance and Insurance by C.S. Tapiero (Kluwer, 1998).

Prerequisite(s): FRE 6083 and FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6311 Dynamic Assets and Options Pricing

1.5 Credits The course focuses on inter-temporal assets pricing in discrete and continuous time. The course explores problems in complete and incomplete markets of both theoretical and practical interest that require an appreciation of financial economic theories and computational techniques. Financial-engineering techniques are introduced including Martingales, stochastic calculus and jump processes; these are applied to engineering problems in finance. Problems and cases are presented that span Stocks and Derivatives (options of various sorts), Bonds and Implied Risk-Neutral Pricing.

Prerequisite(s): FRE 6083 and FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6321 Casualty I

1.5 Credits This course broadens perspectives on the business environment in which actuaries work and analyzes insurance-pricing cycles and regulatory developments. Rating and solvency issues are covered, as well as the rating of individual risks and the concept of loss reserve. The course also touches on issues behind daily events and the impact of current developments in the
actuarial sciences on the actuarial function.

Prerequisite(s): FRE 6051.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6331 Financial Risk Management and Optimization

1.5 Credits This course provides solutions to the inter-temporal problems in financial management including management of portfolios, credit risks and market making. Dynamic and stochastic dynamic programming techniques as well as optimal control and stochastic control principles of optimality are presented, and their financial contexts emphasized. Both theoretical and practical facets of inter-temporal management of financial risks and risk pricing are also stressed. The course uses financial and optimization software to solve problems practically.

Prerequisite(s): FRE 6083, FRE 6091 and FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6341 Casualty II

1.5 Credits This course continues FRE 6321. It covers operational issues of Property and Casualty insurance. Specialized Lines of Business are treated. An introduction to Classification Analysis is given.

Prerequisite(s): FRE 6321.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6351 Advanced Financial Econometrics

1.5 Credits Financial econometrics has matured into a necessary and essential part of financial engineering that provides opportunities to deal with real and practical problems in finance. For example, techniques such as ARCH and GARCH and their subsequent development are used to estimate the volatility of underlying financial processes; the analysis of intraday trading data that requires particular models and techniques; memory-based and fractal stochastic processes to study complex markets behaviors and copulas applied routinely to model- and estimate-dependent risks. These financial and risk problems require the application of advanced financial-econometric techniques, which the course provides from both theoretical and empirical-applied viewpoints. Selected cases provide a real-world sense of financial engineering when it is faced with financial-market reality and complexity.

Prerequisite(s): FRE 6083.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6371 Contract Economics

1.5 Credits This course covers advanced material in applied economics for students of financial engineering. The topics discussed include the development of contractual relationships between parties with dissimilar interests. These include risks of moral hazard and the design of incentives, adverse selection and market signaling, auction theory and the winner’s curse, and distributed and integrative negotiation. Students who complete this course successfully obtain an appreciation for the theoretical
and practical challenges in completing contracts that provide satisfactory economic incentives to each party and satisfy the other party’s belief that the required terms will be met.

Prerequisite(s): FRE 6023.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6391 Mergers & Acquisitions

1.5 Credits This course examines the theories and empirical evidence related to mergers and acquisitions and other corporate transactions and reorganizations. The course looks at friendly mergers, hostile takeovers (including takeover and anti-takeover tactics), leveraged buyouts and bankruptcy. Throughout, the course examines the motives behind these transactions and reorganizations.

Prerequisite(s): FRE 6103 and Graduate Standing.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6411 Fixed Income Securities and Interest Rate Derivatives

1.5 Credits This course examines the body of analytical tools and measures that constitute modern fixed-income markets. The valuation of interest-rate sensitive cash flows is the unifying theme. Major topics include theories of term structure, institutional aspects of fixed-income markets and analytical techniques for managing interest-rate risk. Bond refunding, defeasance, corporate bonds, forwards, futures, options and interest-rate swaps are discussed. The course gives an overview of the major classes of fixed-income securities and the markets in which they trade. Among the major classes of fixed-income instruments discussed are Treasury and agency securities, mortgage-backed securities (including CMOs and Strips), asset-backed securities, municipals, floating and inverse floating rate securities.

Prerequisite(s): FRE 6023, FRE 6083 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6411 Valuation of Fixed Income Securities and Basic Interest Rate Derivatives

1.5 Credits This course examines the body of analytical tools and measures that constitute modern fixed-income markets. The valuation of interest rate-sensitive cash flows is the unifying theme. Major topics include theories of term structure, institutional aspects of fixed-income markets and analytical techniques for managing interest rate risk. Bond refunding, defeasance, corporate bonds, mortgage-backed securities, forwards, futures, options and interest rate swaps are discussed. The course gives an overview of the major classes of fixed-income securities and the markets in which they trade. Among the major classes of fixed-income instruments discussed are Treasury and agency securities, mortgage-backed securities (including CMOs and Strips), asset backed securities, municipals, floating and inverse floating-rate securities.

Prerequisite(s): FRE 6023, FRE 6083 and FRE 6103.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6431 Electronic Market Design
1.5 Credits This course covers the design and analysis of electronic marketplaces. This exciting new research area incorporates ideas from economics (in particular game theory and mechanism design), AI and theoretical computer science. Electronic markets have many interesting applications, from the obvious, such as automated negotiation for e-commerce, to non-obvious applications such as resource allocation in grid-computing settings. The course focuses on computational and game theoretic questions related to electronic markets and looks at what it means to design electronic markets with good properties. Topics include Introduction to game theory and mechanism design; winner determination in combinatorial auctions; bidding languages; approximate single-shot auctions; iterative auctions; preference elicitation and communication complexity; mechanisms for selling digital goods; false-name bids; reputation mechanisms; computationally-limited agents; trading agents; and privacy and auctions.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6451 Behavioral Finance

1.5 Credits This course discusses investors’ systematic deviations from the level of financial rationality assumed by modern financial theory. Such biased behavior can lead to market inefficiencies, market opportunities and market failure. After a brief introduction to the topic and its research history, the course focuses on the limits to arbitrage created by decision bias, the equity premium puzzle, market over-reaction and under-reaction. The course seeks to understand how and where opportunities for and threats to wealth accumulation exist as a result of the mismatch between investor behavior and the assumptions about investment behavior inherent in financial theory.

Prerequisite(s): FRE 6023.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6471 Applied Financial Econometrics

1.5 Credits This course builds on the concepts covered in FRE 6091 and addresses the design, estimation and application of both univariate and multivariate time-series models that are used widely in finance and risk engineering. Financial econometric techniques such as ARCH-GARCH methods and the use of numerical techniques and simulation.

Prerequisite(s): FRE 6083 and FRE 6091.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6491 Municipal and Public Finance

1.5 Credits This course provides an overview and analysis of the market for debt obligations of state and local governments. Topics will include the micro structure of the market, including the types of debt issued, and characteristics of the buyers. Federal and state taxation of munis will be discussed, along with industry regulatory structure. Bond structure, risk assessment and risk management using cash bonds, futures and options will be covered.

Prerequisite(s): FRE 6411.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6511 Derivatives Algorithms
1.5 Credits This course focuses on the algorithms behind derivatives valuation and applications. The focus is on the principles and practice of financial engineering and risk management and on developing intuition: understanding the reasons for the existence of the product, simulating possible paths and possible parameter values as an exploratory process, approximating complex derivatives as a combination of simpler ones, and attempting to replicate the payout. The goal is to prepare students to be able to evaluate an arbitrary derivative given only its term sheet. To that end, the course requires a project almost every week. Projects can be done in any programming language (Excel, Mathematica, R, Python, etc.), but the final result must be stand-alone tables and graphs. The primary prerequisite is familiarity with standard option pricing and Greeks. A portion of the final exam may involve a live computation project.

Prerequisite(s): FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6551 Accounting for Financial Products

1.5 Credits This course addresses accounting issues pertaining to innovative financial products, risk management strategies, tax-driven strategies and other manifestations of financial engineering, particularly those in which derivative financial instruments play an important role. Accounting and tax rules are reviewed and applied.

Prerequisite(s): FRE 6003.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6571 Asset-Backed Securities and Securitization

1.5 Credits This course examines essential contributions in this field and provides a comprehensive coverage of financial securitization and their application to major asset-backed securities, structuring issues and relative value analysis. Topics include the expanding frontiers of asset securitization; introduction to ABS accounting; trends in the structuring of ABSs; and prepayment nomenclature in the ABS market.

Prerequisite(s): FRE 6411 and FRE 6511.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6591 Real Estate Finance and Mortgage-Backed Securities

1.5 Credits This course takes the student from a general introduction to real estate finance and applied mortgage-backed securities (MBS) to a detailed treatment of issues that make real estate and these instruments some of the most complex. Students learn the fundamentals of yield curves, mortgage-cash flows, prepayments and analysis. The course covers pass-throughs, CMOs, mortgage derivatives and ARMs. Asset/Liability management of MBS will be discussed. Students build a price-yield calculator for MBS pass-throughs (using a spreadsheet) and complete a course project.

Prerequisite(s): FRE 6411 and FRE 6571.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6611 Credit Derivatives
1.5 Credits This course introduces credit derivatives and Collateralized Debt Obligations (CDO’s). The course reviews the most important credit instruments and their marketing, starting with risky bonds and credit default swaps, through basket swaps, structured products and CDO’s. Each instrument is defined and explained, including its markets, modeling, pricing and risk management. Class work is illustrated with theoretical homework and practical Excel projects.

Prerequisite(s): FRE 6411 and FRE 6511
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6631 Applied Derivatives and Real Options Finance

1.5 Credits This course focuses on financial-engineering applications using derivatives, alone and in combination with other financial instruments. In addition to studying complex financial-engineering structures, students consider applications of real options to the many industrial and assets management problems dealt with by business firms. Examples of applications include case problems in real options as well as issues in tax arbitrage, the construction of equity collars on restricted stock, the alteration of the investment characteristics of large portfolios, and the creation of synthetic financial instruments.

Prerequisite(s): FRE 6411 and FRE 6511.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6651 Term Structure Modeling and Advanced Interest Rate Derivatives

1.5 Credits This course covers term-structure models, the term structure of volatility, interest-rate processes with time-dependent volatility and mean reversion, a closer look at path-dependent securities, including sinking fund bonds and options with look-back features, multifactor models and multinomial methods of discrete numerical implementations. Course readings are drawn from current literature.

Prerequisite(s): FRE 6411 and FRE 6511. Students are expected to know numerical analysis.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6671 Global Finance

1.5 Credits This course covers the international dimensions of finance. It focuses on markets, players and instruments. It explores the main theoretical insights into the workings of the foreign exchange, international currency and bond markets, and how their integration is used to price securities.

Prerequisite(s): FRE 6411 and FRE 6511.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6691 Intermediate Credit Derivatives Valuation and Applications

1.5 Credits Credit derivatives have emerged as an area of significant interest in global derivatives and risk-management practice. These instruments have the potential to revolutionize the management of credit risk in banking and capital markets. This course introduces the full range of products available in today’s marketplace, the economic value of credit derivatives, valuation techniques and guidelines on using them to manage and control risk.
FRE 6711 Investment Theory and Applications

1.5 Credits This course examines in-depth modern portfolio theory and investment selection. It considers the mathematics of portfolio analysis, single-period risk and return measures and the process of optimal portfolio selection. The basic portfolio model is extended to consider alternative risk concepts and multi-period portfolio horizons. Single-factor and multifactor models are discussed. Optimization techniques, such as linear programming and quadratic programming, are applied. The basic portfolio model is extended to explain hedging theory and to build firm-wide risk management models.

Prerequisite(s): FRE 6411 and FRE 6511.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6731 Basel 2 and Value at Risk

1.5 Credits This course addresses financial risk management and particularly focuses on Basel 2 directives and Value at Risk (VaR), a method to assess risk that employs standard statistical techniques routinely used in other fields. VaR analysis is used by bank and corporate managers and by financial market regulators.

Corequisite(s): FRE 6711.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6751 Credit Risk Measurement and Management

1.5 Credits This course deals with issues in credit-risk measurement, credit-risk management and related areas in which credit considerations are important. These issues arise in credit-rating activity, credit extension by banks and other financial services and in derivative markets where counter-party risk is perceived to be an important management issue.

Corequisite(s): FRE 6711.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6771 Financial Optimization Techniques

1.5 Credits The course introduces optimization concepts intended for coping with financial stochastic processes. The course involves both numerical analysis with commercial solvers and analytical approaches for gaining insights into underlying problems. The course covers three major optimization areas: convex optimization, non-convex optimization and stochastic programming. Conceptual frameworks and techniques are taught through applications and problems in financial engineering and management.

Prerequisite(s): FRE 6311.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 6791 Operational Risk Measurement and Management

1.5 Credits The operational difficulties faced by financial institutions have created a need for tools to measure and manage operational risk. An accurate appreciation of risks, exposures and controls is critical to managing risk effectively in today’s dynamic global business environment. This course examines the effects of transaction processing, liquidity management, organizational structure, personnel and compliance on the nature of operational risk. Qualitative and quantitative measures of operational risk are discussed.

Prerequisite(s): FRE 6711.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6803 Financial Engineering (Research Course)

3 Credits This course is a research/case effort and can be handled in different ways at the discretion of the faculty supervisor. The course may involve a series of cases that are dissected and analyzed. It may involve teaming students with industry personnel for proprietary or non-proprietary research projects. Or it may involve thesis-type research. Generally, students work under faculty supervision, but the course is intended to be largely self-directed within guidelines established by the supervising faculty member. A significant written research component is required.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the chosen project.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6811 Financial Software Laboratory

1.5 Credits This course teaches students to use financial software tools commonly employed in industry. Examples include: @Risk, Yieldbook, Excel, R, and C++.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6821 Financial Econometrics Laboratory

1.5 Credits This course teaches students to use financial econometrics software. Examples include: Eviews, Stata and others.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6831 Computational Finance Laboratory

1.5 Credits This course teaches students to use the software tools employed in computational finance. Examples include: MATLAB, GAMS and other optimization software.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 6861 Financial Software Engineering

1.5 Credits This financial lab requires students to publicly participate in a large software project. This participation could take the form of innovation, such as contributing to an open-source financial software project with the contributions being accepted and committed to the main branch, or invention, such as publishing a stand-alone library or package for a programming language commonly used in financial applications, or pure entrepreneurship, such as the development or updating of a brand-new industrial strength financial software application. As the students work on their project, this course will focus on important software engineering considerations specifically as they apply to the real-time world of financial projects, such as formalized procedures for revision control and bug tracking and other proven methods of software management in a fast-paced financial and business environment.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6901 Selected Topics in Financial Engineering

1.5 Credits Current topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide focus for further study. Examples might include infrastructure and projects finance, international and global finance, economics and finance in developing countries, global finance in a global world, international investment strategies, finance and taxes, among others.

Prerequisite(s): Advanced standing and instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6911 Financial Regulation

1.5 Credits The course provides an overview of the legal and institutional framework of regulations for capital markets, with a strong emphasis on the United States with some discussion of the financial regulation of banks, insurance firms and financial services in general. In addition, attention is given to regulation in global and emerging markets. The goal is to develop a practical understanding for application in business decision making. The course explores the interplay of regulation (both intended and unintended effects), risk management and the evolution of global modern banking. In light of current market developments, the course develops a critical perspective and discusses potential approaches to the structure of financial regulation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 6921-6991 Selected Topics in Financial Engineering

1.5 Credits Current topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide focus for further study. Examples might include infrastructure and projects finance, international and global finance, economics and finance in developing countries, global finance in a global world, international investment strategies, finance and taxes, among others.

Prerequisite(s): Advanced standing and instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
FRE 7023 Financial Engineering Capstone: Internship

3 Credits In this course, the Career Management Center helps the student to secure an internship. Students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A paper based on the internship work is required. This course is graded on the S/U basis.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the internship.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7043 Financial Engineering Capstone: Project

3 Credits In this project course, students work with faculty on proprietary or non-proprietary research projects. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within the guidelines established by the supervising faculty member. A significant written research component is required.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the project to be undertaken.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7103 Macroeconomics

3 Credits Macroeconomics deals with the performance, structure and behavior of a national or regional economy as a whole. This course provides the basic tools for analyzing macroeconomic phenomena. Economic models are developed that explain the relationship between factors such as national income, output, consumption, unemployment, inflation, savings, investment, international trade and international finance. Applications investigate the causes and consequences of short-run fluctuations in national income and attempts at predicting long-run economic growth.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7211 Forensic Financial Technology and Regulatory Systems

1.5 Credits The goal of this course is to understand the technology behind financial forensics and regulatory systems. These include innovative database techniques ("dataveillance"), artificial intelligence, data mining, and non-parametric outlier methods used by the Securities Exchange Commission (SEC), the Financial Industry Regulatory Authority (FINRA), as well as the FBI, and other federal and state agencies. Students will learn how to incorporate these technologies in the regulatory environment of the future. Student teams will prepare and present projects or case studies applying the concepts covered in class.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7221 Databases and Financial Information Technology
1.5 Credits This is an advanced course on practical computer science topics most relevant to financial applications. As such it covers fundamental concepts such as database design, use, and maintenance, algorithmic complexity and efficiency considerations, memory optimization and grid performance, and, primarily, the use and importance of financial specification languages such as MDDL and FpML and financial communication standards such as FIX. Students will work on numerous projects, including attaining hands-on experience with a FIX engine.

Prerequisite(s): FRE 6151.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7241 Algorithmic Portfolio Management

1.5 Credits This course focuses on portfolio construction and rebalancing strategies such as momentum, value, and size strategies, among others. The course emphasizes back-testing and risk factor analysis as well as optimization to reduce tracking error. It will also address how a quantitative investment approach can help both individual and institutional investors make sound long-term investment decisions.

Prerequisite(s): FRE 6123.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7251 Algorithmic Trading and High-Frequency Finance

1.5 Credits Algorithmic trading refers to the utilization of special computer programs in an order management system that restructure an order into a sequence of sub-orders based on the dimensions of submission time, price, size, and side. The goal of this course is to survey several algorithmic strategies used by financial institutions and to understand their implementation in the context of order management systems and standard financial protocols (such as FIX and FIXatdl). Student teams will prepare and present projects or case studies applying the concepts covered in class.

Prerequisite(s): FRE 6151 and FRE 7221.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7261 News Analytics and Strategies

1.5 Credits The fast-growing field of news analytics requires large databases, fast computation, and robust statistics. This course introduces the tools and techniques of analyzing news, how to quantify textual items based on, for example, positive or negative sentiment, relevance to each stock, and the amount of novelty in the content. Applications to trading strategies are discussed, including both absolute and relative return strategies, and risk management strategies. Students will be exposed to leading software in this cutting-edge space.

Prerequisite(s): FRE 6151 and FRE 7221.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 7801 Topics in Finance and Financial Markets I
Current topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide focus for further study. Examples might include Financial Economics, Macroeconomics and Finance, the Bond market, the securities markets, Derivatives markets, Contract Theory, Credit and Counterparty Risks, Banking Finance and others.

**Prerequisite(s):** Graduate standing and instructor’s permission.

**Weekly Lecture Hours:** 1.5 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FRE 7811 Topics in Finance and Financial Markets II

Current topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide focus for further study. Examples can include Behavioral Finance, Personal Finance, Investment Theories and Alternative Finance, Corporate and Financial Responsibility, Financial Ethics, Hedge Funds Investment Strategies and their Management and macro hedge funds management, among others.

**Prerequisite(s):** Graduate standing and instructor’s permission.

**Weekly Lecture Hours:** 1.5 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FRE 7821 Topics in Actuarial Science I

Current topics of particular importance in Actuarial Science are analyzed and discussed. Course topics may include for example: Pension Funds management, Actuarial Science and Social Security, Life Insurance, Insurance and Financial Products design and management.

**Prerequisite(s):** Advanced standing and instructor’s permission.

**Weekly Lecture Hours:** 1.5 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FRE 7831 Topics in Financial and Risk Engineering I

Current and selected topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide a focus for further study. Topics include Credit Risk and Credit Derivatives, Quantitative Methods in Rare Events, Energy, Oil and Water Finance as well as advanced topics in financial econometrics and computational finance.

**Prerequisite(s):** Graduate standing and instructor’s permission.

**Weekly Lecture Hours:** 1.5 | **Weekly Lab Hours:** 0 | **Weekly Recitation Hours:** 0

### FRE 7841 Topics in Actuarial Science II

Current and selected topics of particular importance in Actuarial Science and in the insurance-finance convergence are analyzed and discussed. Course topics may include Risk Engineering and the Insurance Business, Principles of Insurance Management in a Dynamic and Global Setting, Finance-insurance convergence.
FRE 7851 Topics in Financial and Risk Engineering II

1.5 Credits Current topics of particular importance in finance and risk engineering are analyzed and discussed. Selected topics are emphasized and provide a focus for further study. Examples can include urban finance engineering, environmental finance, infrastructure and projects finance, real-estate finance, insurance finance and derivatives, and macro hedge funds management.

Prerequisite(s): Graduate standing and instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

FRE 9973 MS Thesis in Finance & Risk Engineering

3 Credits In this research course, students undertake proprietary or non-proprietary research and write a thesis-type research paper. Generally, students work under faculty supervision. However, the course is intended to be largely self-directed within guidelines established by the supervising faculty member.

Prerequisite(s): This course should be taken during the student’s final semester. Prerequisites vary depending on the student’s track and the nature of the thesis project.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

General Engineering

General Engineering

EG 1 Examination Hour

EG 1001 Engineering and Technology Forum

1 Credits In this course, the notions of invention, innovation and entrepreneurship (i2e) are brought to the forefront of students’ educational experience in an effort to introduce undergraduates to elements of a research-intensive institution and encourage intellectual and scholarly interaction with their peers and faculty. This course includes presentations and discussions on emerging and exciting topics by leading engineers, scientists, inventors and entrepreneurs discussing case studies on innovations, inventions and entrepreneurship as well as relevant contemporary and emerging environmental-, economic-, global-, energy- and health-related topics. The course exposes students to an array of collegiate academic skills such as the elements of a research-intensive institute, information-technology resources and ethics in science and engineering, as well as discussions of student life–
related topics and issues.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

EG 1003 Introduction to Engineering and Design

3 Credits This course introduces selected aspects of the history, philosophy, methodology, tools and contemporary topics in engineering. Also included are basic engineering experimentation and data analysis, a team-design project and analysis and presentation of engineering data and designs.

Weekly Lecture Hours: 5 | Weekly Lab Hours: 2.5 | Weekly Recitation Hours: 2

General Studies

General Studies

GS 101 Computer Skills for Engineers

This course focuses on the basic functions and intricacies of AutoCAD, MATLAB and/or Python, Microsoft Word, Excel, Project and PowerPoint. Course requirements: weekly lab assignments, a midterm and final exam, and an individual project synthesizing the course content.

GS 102 Pre-college Writing

This course prepares students for college-level writing. Class time includes reading and writing exercises, grammar quizzes and lessons and a close examination of student writing (workshops).

GS 103 Pre-college Math

This course prepares students for math at NYU-Poly. The math course taken over the summer will be determined by the results of the Math Assessment. Course requirements: daily participation, weekly quizzes, daily homework assignments and a midterm and final exam.

GS 106 Pre-college Physics
This course introduces the foundational concepts and laws of physics and their connection to the engineering disciplines. The subject matter helps students apply scientific methods to physical problems and prepares them for university-level physics. Topics include vectors, kinematics, Newton’s Laws, work and energy, momentum and collision theory, rotational motion, and angular momentum. Course requirements: daily participation, weekly quizzes, daily homework and a midterm and final exam.

Higher Education Opportunity Program

Higher Education Opportunity Program

HE 1 Study Skills

NC Credits This skills workshop prepares students for the academic and social challenges of college. Workshop topics include self-exploration and development of skills, such as taking notes, preparing for examinations and evaluating academic goals. This course is offered only in the fall semester.

| Weekly Lab Hours: 1 | Weekly Recitation Hours: 0

History

History

HI 2003/W The Age of Conquistadors

3 Credits This course will focus on European discovery of Americas since 1492. Emphasis will be given more to the conquest of Americas in Caribbean, Mexico, Peru, Central America, New Mexico and Brazil. In doing so, this course will address the role of the Catholic Church, the imposed imperial system and the sufferings of indigenous people. For many historians, 1492 is the landmark of European-dominated modernity. While the Chinese made a major breakthrough in navigation and while the Arab merchants traded globally, the Europeans were far behind in modernity. But by 1492 Europeans expanded its horizons to the Americas, Asia and Africa. Was it because of gold? Was it because of religious motivation? Or was it to save the “savages”? What consequences did the indigenous population face? What advancement did the Europeans make in such ventures? This course will address these questions.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.

Note: Satisfies a humanities and social sciences elective.
HI 2053/W Intro to Urban Policy

3 Credits The purpose of this course is to introduce students to the process and some of the major substantive issues in urban policy and politics in the United States, with some transnational contrasts. These include some of the basic issues of any political system: how cities function as part of a global urban network; the structure of decision-making, the allocation of resources and delivery of services.

Note: Satisfies a humanities and social sciences elective.

HI 2103/W Western and Non-Western Societies

3 Credits The course introduces a comparative study of Western and non-Western societies, emphasizing the importance of Western and non-Western relations and the impact Europe made upon the rest of the world.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

HI 2113 The Making of the Modern World

3 Credits This course provides a systematic and broad survey of the political, social, technological and cultural history of the world from the early sixteenth century to the present. The course examines major events and themes that have shaped the development of the modern world over the past four centuries, including: Capitalism and Technology; Exploration, Mapping and Measurement; the Industrial Revolution; Technology and Colonial Imperialism; and Technology and War in the 20th Century.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

HI 2163/W History of Mass Media

3 Credits This mass-media history course examines broadsides, newspapers, cinema, radio, TV and the Internet, from the advent of cheap print in the early modern period to the turn of the 21st century. Themes include the history of mass-media technology, the mass dissemination of news and its effects on popular culture and gender relations, sensationalism, and the role of the media in developing advertising and consumer culture.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

HI 2203/W Medieval Technology

3 Credits This course considers medieval heritage, culture, society, technology and its impact and continuity in modern times. The course looks at the nuclear family as it originated in medieval times, and emphasizes concepts of modern law, religion, war, science, race and class.
HI 2213 History of Aviation and Aviation Technology

3 Credits In little more than 100 years, aviation has passed from a ground-hugging flight of less than a minute to high-altitude, supersonic flights that cross continents and oceans. This course surveys the history of aviation and the technological innovations that led to this crucial modern technology. This course also discusses the physics of flight, how increased understanding of aerodynamic principles led to successive aircraft improvements, and the development of new materials and control systems. Although military research drove many technological innovations, this course focuses on the economics and development of commercial aviation, which has changed the world. The course also looks at ultramodern trends in aircraft design and control, including unmanned cruise missiles and aircraft, and new commercial-aircraft designs and production techniques.

HI 2223/W Physics and Society

3 Credits This course examines the historically contingent relationship between physical knowledge and society, from ancient Greece to the present. Investigations include how scientific knowledge is constructed locally and the impact of sociocultural factors on such knowledge. The course also examines the conceptual foundation of physics, its history, and how physics has influenced culture and society over two millennia.

HI 2233 Introduction to the History of Western Technology

3 Credits This course surveys generally the history of technology (from the early modern period to the present) and investigates how technology shapes society, and how society molds technology. Topics include ancient technologies, the printing press, the Industrial Revolution, the replacing of laborers with machines, electricity, transportation, Ford and the invention of the automobile, Taylorism and the organization of labor, technology during World War II (including radar, V1 and V2 rockers and the Enigma machine) and the rise of the NASA space program.

HI 2243/W The History of Light

3 Credits What is the nature of light? How does it relate to magnets, electric circuits, TVs, radioactivity and the fundamental forces of nature? More importantly, what really happens to your burrito when you microwave it? This course answers these and similar questions by following the historical development of three apparently distinct and unrelated phenomena—electricity, magnetism and light. Topics range from descriptions of these phenomena by the Greeks to Maxwell’s 19thcentury unification of
them into a single phenomenon to Einstein’s theory of special relativity to their incorporation into the Standard Model of contemporary physics. The course considers theoretical descriptions of the phenomena and technologies derived from them.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 2253/W From Heat Engines to Black Holes**

3 Credits  What is the nature of heat? How does it relate to atoms, black holes, information and a demon in a box full of gas molecules? This course answers these questions by developing the history of thermodynamics. That history begins with early 18th-century caloric theories of heat, 19th-century analyses of steam engines, the kinetic theory of gases, the statistical approach to mechanics, atomic theories of matter, the concept of entropy, early 20th-century concepts of information and, finally, current applications to black holes (as well as Maxwell and his famous demon). The course considers theoretical descriptions of the phenomena and the technologies derived from them.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 2263 The Ship**

3 Credits  Ships, the largest human-made moving objects, have played a pivotal role in trade and warfare throughout history. This course covers the history, development and technology of ships from ancient times to the present. The course discusses aspects of the atmosphere and seas as they relate to ship design and use. Technological advances in hull design, materials, sails and power also will be discussed. The use of ships in trade, human transportation, warfare, fishing, piracy and global exploration are covered, along with the satellite industries of shipbuilding and port support. The course also looks at the manning of ships, the social and military organization, the life of mariners, the development of navigation and its technologies in an historical context, and submarine evolution and technologies.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 2303/W Introduction to New York City History**

3 Credits  This course looks at the history and development of the City of New York, from Verazzano’s exploration to the present. Major themes include the evolution of the city’s political economy, political and economic influences on land and space use, and ethnic and class conflict in the urban environment.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 2313/W History of New York’s Urban Infrastructure**

3 Credits  This survey of New York City’s infrastructure concentrates on water, sanitation and public health, electrical and communications systems, the development of housing and real estate, the security infrastructure and plans for the future. The
course explores how the city’s political economy has shaped its physical environment and how technological innovations have made the city modern and postmodern.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 2353 A History of NYC Transit and the Development of NYC**

*3 Credits* This course traces the technological history of public transportation in New York City and investigates its role in the development of the city, its economy and its social fabric. From the early days of horse-drawn public carriages to the modern subway system, the role of the public transit in the historical development patterns of New York City is treated. The course covers trolley systems, the age of the elevated railways and the subway system. Political, social and economic issues involved in the development of these critical infrastructures are discussed. Students develop independent project reports on aspects of the NYC public transit system, or on public-transit systems in other major world cities.

Prerequisite(s): Junior Status or permission of instructor.
Note: Satisfies a humanities and social sciences elective.

**HI 2713 Urban Environmental History**

*3 Credits* This course will examine the development of cities, primarily in North America, the evolution of the technologies used for that development, and their effect on the natural environment of cities and their regions, and the effects of the modernization and electrification of rural America on cities. Students will use a broad toolkit of historical methods and modes, including environmental history, social history, world history and history of technology.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 3103 Modern Asia**

*3 Credits* This course explores the major Asian civilizations since the mid-17th century, concentrating on their social, political, economic, religious and cultural histories. The course emphasizes principal Asian civilizations of China, India and Japan and also looks at Vietnam, Afghanistan and Iran.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

**HI 3253 History of Political Technology**

*3 Credits* This course will examine the history of American elections through the lens of the technologies employed to win them—from the use of the barbeque and distilled whiskey used from Colonial period through the 19th century to the advent of polling, marketing and the blogosphere in the 21st century.
HI 3303 Science and Technology as a Strategic Resource in World War II

3 Credits This course examines the role of technology and science during World War II. Among the technologies that are considered are some that were inherited from World War I and much improved (e.g., tanks, airplanes, aircraft carriers and submarines). Others were completely new and required considerable scientific input to be developed (e.g., radar, code breaking by the use of computers, jet engines, ballistic missiles, antibiotics and the atomic bomb).

Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

HI 3313/W History and Literature of New York City in the 20th Century

3 Credits This course examines the history and literature of New York in the 20th century, focusing on the city’s social and technological evolution since the late 19th century.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

HI 3403 History of Political Technology

3 Credits This course examines the history of American elections through the lens of the technologies employed to win them—from the use of the barbeque and distilled whiskey in the Colonial period through the 19th century to the advent of polling, marketing and the blogosphere in the 21st century.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

HI 3413 History of Intellectual Property in America

3 Credits This course, a history of successive regimes of patent, trade secret, copyright and trademark law from the early modern period to the present, introduces undergraduates to basic intellectual property concepts, language, the political and distributive implications of intellectual property regimes, and the possibility or even inevitability of alternative regimes.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

HI 4333/W Seminar in Urban Infrastructure History
This seminar investigates the urban and environmental history of New York City's infrastructure, including water, sewage, transportation, housing and office construction. The course investigates these systems in the context of the environmental, political and economic concerns that shape the city's infrastructure. The course looks at the transnational circulation of ideas about designing and constructing urban systems. Questions include: How and why are infrastructure systems built? Why are they built the way they are? How do the technologies used affect the environment? Are the systems sustainable and interoperable? How do ideas about infrastructural needs, design and financing circulate transnationally?

Prerequisite(s): HI 2313/W or instructor's permission.
Note: Satisfies a humanities and social sciences elective.

Industrial Engineering

Industrial Engineering

IE 6003 Engineering Economics

This course is offered irregularly in Response to industry demand.

IE 6063 Work Design and Measurement

This course is offered irregularly in Response to industry demand.

IE 6113 Quality Control and Improvement

3 Credits This course provides students with a solid foundation in the cost of quality, quality assurance and quality management. Emphasis is on the basic tools of quality control such as control charts and their use, the concept of “out of control,” acceptance sampling, variables and attributes charts and producer’s and consumer’s risk. A unique aspect of this course is the demonstration of the power of teams of people with different expertise to improve quality. A course project is required.

Prerequisite(s): MA 6513 or familiarity with the concepts of probability and statistics.
Also listed under: MN 6113.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6123 Quality Engineering Using Robust Design
This course provides a broad review of procedures to improve manufacturing quality. By employing both Taguchi techniques, such as the use of signal-to-noise ratio representations and other techniques less sensitive to parameter interactions, a full spectrum of robust design methods are presented. Applications of these procedures are reviewed, including online trouble-shooting methods to assure manufacturing quality.

Prerequisite(s): IE 6113.
Also listed under: MN 6123.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6163 Job and Workplace Design

This course examines theory, research and applications of job and workplace design. Job design is presented from an interdisciplinary perspective, focusing on how job design influences attitudes and work behavior within organizations. Students are exposed to diagnostic tools for measuring and evaluating jobs and the psycho-social aspects of the workplace environment, as well as the principles of work redesign. Topics include influences on work design by innovations in information technology, modern manufacturing, virtual work arrangements and open office systems; design and support of effective work teams; re-engineering and total quality management; and privacy and communication in the workplace.

Also listed under: MG 6163.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6183 Inventory Models

This course is offered irregularly in Response to industry demand.

IE 6193 Production Planning and Control

This is a survey course in basic and advanced manufacturing planning and control systems, covering short-term forecasting systems, master production scheduling, material requirements planning, inventory management, capacity management, production activity control and just-in-time.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6203 Project Planning and Control (Project Management)

This course discusses the knowledge and process required to manage a project through its life cycle, from concept to completion. Topics include engineering analysis, screening and selection, configuration and total quality management, scheduling using Program Evaluation and Review Technique (PERT) and Critical Path Method (CPM), budgeting and resource management, computer support and software. Case studies are used to illustrate the process.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
IE 6213 Facility Planning and Design

3 Credits Topics in this course include facilities design for global competitiveness, strategic master site planning, site selection, factory layout and design, facility-management systems and materials handling and storage planning. Also presented are guidance on selecting alternative facility plans and application of queuing methods and computer modeling for facility design and evaluation.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6273 Operations Research: Deterministic Models

This course is offered irregularly in Response to industry demand.

IE 6273 Operations Research: Deterministic Models

3 Credits Development of mathematical models for solving decision problems of deterministic nature. Classical optimization, Lagrange multipliers, linear programming, transportation method, network procedures, games. Dynamic programming.

Prerequisite(s): Calculus.
Weekly Lecture Hours: 2.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6283 Operations Research: Stochastic Models

This course is offered irregularly in Response to industry demand.

IE 6283 Operations Research: Stochastic Models

3 Credits Mathematical models for solving decision problems of stochastic nature. Queuing, Markov processes, inventory models, reliability, probabilistic dynamic programming. IE 6273 and IE 6283 constitute standard one-year survey course in operations research.

Prerequisite(s): MA 6813.
Weekly Lecture Hours: 2.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 6453 Productivity Management
Credits

This course examines modern approaches to productivity measurement, evaluation, planning and improvement in both manufacturing and service industries. Participants develop productivity models for various types of organizations.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 6503 Queuing Systems I**

This course is offered irregularly in response to industry demand.

**IE 6823 Factory Simulation**

*3 Credits* This course examines modeling and simulation of complex industrial, commercial and service systems, such as factories and hospitals. Students develop, run and test several simulation models using different software packages.

*Prerequisite(s):* Computer literacy.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 6853 System Reliability**

This course is offered irregularly in response to industry demand.

**IE 7113 Engineering Applications in the Business Environment**

*3 Credits* This course fills the gap between theory and practice by immersing the student into actual engineering problems in operating businesses. Students work with an engineering manager in the client company and under the academic supervision of a faculty member to solve real engineering problems. Student will apply the knowledge acquired through course work to solving current industrial problems. By identifying a single project for the student, the course will focus on applying theory and academic knowledge to the analysis and improvement of the clients’ processes, products and operations. Students will experience the difference between the class room setting and business setting in applying engineering skills to problem solving. Students will experience the demands of meeting deadlines and providing cost – benefit solutions as professional engineers in the practice of engineering. This course provides the student with an opportunity to bridge the gap between theory and practice while still in school.

*Prerequisite(s):* Permission of the Instructor.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 7213 Engineering Applications in the Business Environment**

*3 Credits* This course fills the gap between theory and practice by immersing the student into actual engineering problems in operating businesses. Students work with an engineering manager in the client company and under the academic supervision of a faculty member to solve real engineering problems. Student will apply the knowledge acquired through course work to solving current industrial problems. By identifying a single project for the student, the course will focus on applying theory and academic
knowledge to the analysis and improvement of the clients’ processes, products and operations. Students will experience the
difference between the class room setting and business setting in applying engineering skills to problem solving. Students will
experience the demands of meeting deadlines and providing cost – benefit solutions as professional engineers in the practice of
engineering. This course provides the student with an opportunity to bridge the gap between theory and practice while still in
school.

Prerequisite(s): Permission of the Instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 7653 Human Factors in Engineering Design**

This course is offered irregularly in Response to industry demand.

**IE 7753 Industrial Safety Engineering**

This course is offered irregularly in Response to industry demand.

**IE 7763 Manufacturing Resources Planning**

3 Credits This course studies computerized systems to effectively run a manufacturing business. Also covered is the process of
software specification, evaluation, selection and implementation. Topics include Manufacturing Resources Planning (MRP)
logic, enterprise resource planning, manufacturing execution systems, inventory management and bill of materials. Several
software systems and their features are highlighted.

Also listed under: MN 7763.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 7853 computer Integrated Manufacturing Systems**

3 Credits This course examines the basic concepts of manufacturing complex products with complex processes. It relies heavily
on computer and data processing technologies, which are introduced. Also a variety of perspectives are addressed from all
aspects relative to products and processes-planning, design, manufacturing and shipping. Students explore techniques for
managing and optimizing manufacturing productivity.

Also listed under: MN 7853.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**IE 7873 Lean Manufacturing**

3 Credits This course provides an overview to the basic principles, and theories of lean manufacturing which involves identifying
and eliminating non-value-adding activities in design, production, and supply chain management. Students will learn an
integrated approach to efficient manufacturing with emphasis on synchronized product, quick changeover, cell design, visual
factory, value stream, one-piece flow and understand the metrics used to monitor performance.

Also listed under: MN 7873.
Note: Online version available.

IE 7883 Manufacturing Systems Engineering

3 Credits Topics in this course concentrate on contemporary techniques for product design and manufacture, including financials of the manufacturing firm, quality, reliability, Taguchi methods of product and process design, scaleup and partitioning, production flows, modern manufacturing methods such as JIT/TQC, pull and synchronized manufacturing. Cultural factors are also discussed.

Also listed under: MN 7883.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 7923 Design for Manufacturability

3 Credits This course introduces concepts and techniques for economical, functionally sound and high-quality product design for manufacture. Emphasis is on designing for easy assembly, manually and with robotics and on the effective use of plastics to reduce manufacturing costs. Managerial and organizational approaches and case studies of successful designs are reviewed.

Also listed under: MN 7923.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 7933 Environmental Health and Safety

3 Credits This course presents an overview of environmental, health and safety management, and introduces students to management systems within a manufacturing operation. The course explores motivations and strategies for environmental, health and safety management. Students learn about the mandatory standards understanding the technical and legal rationale for insuring that workers are provided with a safe and healthy workplace. These skills are needed to work effectively in operations, human resources and employee development as well as in industrial relations, since the law provides workers specific safety and health rights.

Also listed under: MN 7933.
Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 7993 Supply Chain Engineering
3 Credits Students in this course gain an understanding of how companies plan, source, make and deliver their products with a global competitive advantage. The course stresses the engineering components in developing an integrated supply chain that covers the entire manufacturing enterprise. It looks at the supply-chain infrastructure and the velocities of different models. The focus is on understanding and detecting the constraints of the infrastructure and the lowest common denominator of the information system used. Students also gain an understanding of logistical networks and the optimizing of the various traffic and location alternatives. Synchronization of supply and demand is examined in detail, looking at variability in both processes with the objective of maximizing throughput and capacity, emphasizing partnering, e-commerce and the bullwhip effect. Finally, the course establishes global performance measurements that compare companies in different industries.

Also listed under: MN 7993.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 9113 Selected Topics in IE

3 Credits These topics cover areas not covered in other courses. Specific topics vary according to instructor, who may be a visiting professor. Topics and prerequisites announced during the term before classes.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 9123 Selected Topics in IE

3 Credits These topics cover areas not covered in other courses. Specific topics vary according to instructor, who may be a visiting professor. Topics and prerequisites announced during the term before classes.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

IE 9303 Readings in Industrial Engineering I

3 Credits In this course, students individually read selected papers and current literature in specialized area and are guided by a faculty member.

Prerequisite(s): Approval of adviser, instructor and department head.

IE 9313 Readings in Industrial Engineering II

3 Credits In this course, students individually read selected papers and current literature in specialized area and are guided by a faculty member.

Prerequisite(s): Approval of adviser, instructor and department head.

Journalism
Journalism

JW 6003 Introduction to Technical Communication

3 Credits This course is an overview of the research, writing, editing and design principles of technical communication. Particular attention is paid to writing for new media. Students learn to gather, organize and present information effectively, according to audience and purpose. Interviewing skills, technical presentation skills and writing for the Web are covered.

Prerequisite(s): Adviser's approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

JW 6313 Proposal Writing

3 Credits

Life Sciences

Life Sciences

LS 2314 Organismal Physiology

4 Credits Mechanism involved in functional processes of cells and multicellular organisms, including integration and control aspects. Membrane function, transport, excitation, conduction, contraction, luminescence. Lab fee required.

Prerequisite(s): BMS 2004 and CM 1004 or CM 1024. Corequisite(s): PH 2023.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

Technology Management

Graduate Courses

The MOT program’s series of required courses provide participants with a deep understanding of the foundations of managerial competencies needed to manage innovation in the evolving business environment. In addition, participants can choose an elective
from the Department of Technology Management or from other areas of the Institute that can enhance their understanding of a particular area of interest in the broadly defined arena of technology management.

**Technology Management**

**Graduate Courses**

The MOT program’s series of required courses provide participants with a deep understanding of the foundations of managerial competencies needed to manage innovation in the evolving business environment. In addition, participants can choose an elective from the Department of Technology Management or from other areas of the Institute that can enhance their understanding of a particular area of interest in the broadly defined arena of technology management.

**MG 997X MS Thesis in Technology Management**

*3 Credits* Students choose original investigation topics for their theses. While they conduct research and draft their theses, students are required to confer with their advisers and to submit progress reports. A final written report is required at completion. The department may request an oral examination.

*Prerequisite(s): Degree status and approval of supervising professor, MSM Program Director and TM department chair.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 999X PhD Dissertation in Technology Management**

*3 Credits* Students are required to complete 24 credits of doctoral dissertation research.

*Prerequisite(s): Doctoral standing or instructor’s permission.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 1002 Foundations of Management**

*2 Credits* This course introduces the principles and practices of management. Management is viewed as a system of tasks and activities, including environmental scanning, planning, organizing, leading and controlling. Within each major task, is a series of processes, which show how to do what has to be done. Management is a science and an art; both aspects of management are covered in this course. Major emphasis is on management history, philosophy and the theory and practice of management planning, decision making, organizing, motivating and leading.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 2004 Management of Information Technology and Systems**

*4 Credits* This course provides a foundation to understand the role and potential contributions of information technologies and systems in business organizations—what they are, how they affect the organization and its employees, and how they can make businesses more competitive and efficient. The course focuses on the current state of IT in organizations; challenges and strategic
use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process reengineering, knowledge management and group-support systems.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 2014 Operations Management**

*4 Credits* A firm has the opportunity to create competitive advantage through proficient operations management. To do so, the firm first must recognize and establish the strategic role of its operations within the organization. Then, at the more detailed operational level, the firm must execute effectively and efficiently. This course examines the strategic role that the operations function can play and offers specific tools and techniques that a firm can use during implementation.

*Prerequisite(s): 4 credits of calculus.*

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 2104 Organizational Behavior**

*4 Credits* This course focuses on the study of human behavior in innovative organizations. Emphasis is on teams, leadership, communication theory and organizational culture and structure. The course includes analyses of organizational behavior problems through case studies and participation in experiential learning.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 2204 Financial Accounting**

*4 Credits* This course provides a solid foundation in constructing and interpreting financial statements. Topics include: accounting terminology, financial-statement preparation and analysis, liquidity and credit-risk ratios, depreciation calculations, revenue recognition, accrued liabilities and asset valuation. Also covered are the effects of equity transactions, cash flows and various accounting methods on financial statements.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 2304 Marketing**

*4 Credits* This course is an undergraduate introduction to marketing. It discusses the fundamentals of marketing; e.g., the marketing mix, the role of the customer, marketing research and survey techniques. In addition, emerging marketing paradigms, like relationship marketing and online marketing, are introduced.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 3002 Project Management**
This course provides students with practical and best-practice project management theory, concepts and (hands-on) practical experience so that they may contribute effectively to and lead multicultural team projects framed for the new global economy. The practical component includes a team-based project that spans the duration of the course.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 3024 Management of Data Communications and Networking**

*4 Credits* This course introduces the fundamentals of modern telecommunications and networking such as components of data communication, data transmission, open-system interconnection (OSI), TCP/IP and other models, data link and network layers and local area networks (LANs). The course focuses on managerial issues related to the management of data communications and networking technologies.

*Prerequisite(s): MA 1024 and MA 1124 or equivalents and MG 2004.*
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 3204 Introduction to Finance**

*4 Credits* This course introduces business finance for BTM majors. It emphasizes the financing and investment decisions of the financial manager, with special emphasis on examples from technological environments. Included are topics such as time value of money, asset valuation, risk analysis, financial statement analysis and capital budgeting.

*Prerequisite(s): MA 1024 and MA 1124 or equivalents and and MG 2204.*
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 3214 Advanced Corporate Finance**

*4 Credits* This course builds on the principles of basic corporate finance covered in MG 3204. It prepares students to understand financial theory and how firms use modern finance for strategic and tactical decision-making. The critical issue of how these decisions affect the value of a firm and the returns of assets is addressed. Major topics include bond valuation, the CAPM model, portfolio design and modeling and option pricing using the Black-Scholes model. A strong emphasis is placed on using spreadsheets as a financial-modeling tool.

*Prerequisite(s): MA 1252 and MG 3204.*
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 3304 Introduction to Supply Chain Management**

*4 Credits* This course provides an undergraduate-level introduction to supply-chain management. The underlying objective is to introduce key supply-chain management concepts and examine relevant business practice. This course enables students to develop useful skills, in an increasingly global context, to analyze marketing, logistics, operations and channel management issues.
Prerequisite(s): MG 2004, MG 2304 and MA 2054 or MA 2212 with MA 2222.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 3404 Innovation Management

4 Credits This course examines the key managerial features of technology-enabled innovation and new product development. It focuses on accessing innovative capabilities through R&D, acquisition, alliances, joint ventures and innovation-friendly cultures and organizations. The key perspective underlying this course is managerial. Although the innovation activities studied are overwhelmingly technology enabled ones, success is largely determined by managerial factors. The interplay between the technology and management leading to innovation is a major concern of the discussion and work in this course.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4004 Management Strategy in Technology Sectors

4 Credits This course provides an overview of the process of implementing a successful management strategy in an information-, technology and knowledge-intensive environment. Fundamental topics include the development of strategic vision, objectives and plans; implementation of strategy and the evaluation of performance; industry and competitive analysis; SWOT analysis and competitive advantage and sustained advantage. Advanced concepts include strategic positioning in global markets, Internet strategy, strategy in diversified firms and interactions between organizational structure and strategy and between ethics and strategy.
Prerequisite(s): MG 3204 and MG 3404.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4014 Introduction to E-Business

4 Credits Since its introduction, the Internet has changed how businesses work. In addition to creating new opportunities, the Internet has revolutionized existing businesses and entire industries. This course provides an undergraduate-level introduction to e-business. The main objectives of this course are to (1) provide a hands-on introduction to the emerging area of e-Business, (2) discuss the major business concepts and issues in this domain and (3) develop high-quality content based on team discussion and individual/group research.
Prerequisite(s): MG 3204, MG 3002, MG 3304 and MG 3404.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4111 Special Topics in Management (1 Cr)

1 Credits Focus on a special topic in Management under the guidance of TM faculty member.
Note: Pre-approval required by BS BTM Program Director or TM Department Chair.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 4112 Special Topics in Management (2 Cr)

2 Credits Focus on a special topic in Management under the guidance of TM faculty member.

Note: Pre-approval required by BS BTM Program Director or TM. Department Chair.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4113 Special Topics in Management (3 Cr)

3 Credits Focus on a special topic in Management under the guidance of TM faculty member.

Note: Pre-approval required by BS BTM Program Director or TM. Department Chair.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4114 Special Topics in Management (4 Cr)

4 Credits Focus on a special topic in Management under the guidance of TM faculty member.

Note: Pre-approval required by BS BTM Program Director or TM. Department Chair.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4204 Management Science

4 Credits This course teaches students to create mathematical models of managerial problems. Types of models discussed include linear programming, integer-linear programming, non-linear programming, queuing models, decision-tree models, game-theoretic models, simulation models, inventory models and more. Each model is discussed in the context of the assumptions necessary for modeling and the robustness of the model’s managerial recommendations.

Prerequisite(s): 6 credits of calculus and (MA 2054 or MA 2212 and MA 2222).

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4214 Financial Strategy

4 Credits This course deals with the financial strategy of modern firms. Topics include planning and implementation of financial strategies for start-up businesses and the utilization of venture capital; diverse issues related to designing financial strategies of rapidly growing companies after experiencing an IPO; challenges in constructing a financial strategy while undergoing a major corporate restructuring; key components of financial strategies for companies facing rapidly changing technological and competitive environments; and development of financial strategies for mature companies and declining business.

Prerequisite(s): MG 2204 and MG 3204.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
**MG 4404 Entrepreneurship**

*4 Credits* This course focuses on key aspects of entrepreneurship as a critical engine for innovation. It also treats entrepreneurship as a state of mind that is not limited to small firms. Students discuss current theories and practices related to starting and managing entrepreneurial enterprises, emphasizing firms in technology-, information- and knowledge-intensive environments. Particular attention is paid to the critical issues of (1) identifying opportunities that provide competitive advantage; (2) the development of a solid business plan; (3) the marketing of new ventures; (4) entrepreneurial business operations, including human-resource and process management; (5) ethical and social issues in entrepreneurial firms; and (6) financial management and fund raising for entrepreneurial firms.

*Prerequisite(s):* Junior or senior student status.

*Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0*

**MG 4504 Global Perspectives on Technology Management: A Capstone Project Course**

*4 Credits* This course provides students with knowledge of current theories and practices related to managing international and multinational firms. Students study the ways in which international management differs from the management of a firm residing solely within domestic boundaries. Topics covered include planning, organizing, HR management, communication and negotiation and coordination and control of international endeavors. Case studies are used extensively to focus the class on technological examples of problems in international management. Students undertake a term project that either (1) develops a business plan for a technological international venture, (2) creates a case study of a technological firm’s challenges in international management, or (3) analyzes a technological industry’s position vis-à-vis international management.

*Prerequisite(s):* MG 3002, MG 3024, MG 3204, MG 3304 and MG 3404.

*Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0*

**MG 4514 Honors Capstone Project in Technology, Innovation and/or Information Management and Entrepreneurship I**

*4 Credits* Directed toward developing theory, developing case material, or developing a business plan and business strategy for a new venture, or another project of this caliber. A Thesis or Honor’s Thesis may compose part of this Honor’s Capstone course.

*Prerequisite(s):* senior status, 3.6 GPA or better through the junior year in major; all courses specified by the project adviser.

*Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0*

**MG 4524 Honors Capstone Project in Technology, Innovation and/or Information Management Or Entrepreneurship II**

*4 Credits* In this course, qualified honors students work with a faculty member (and perhaps graduate students) on an advanced topic in technology, innovation and/or information management or entrepreneurship. This effort may be directed toward developing theory, developing case material or developing a business plan and business strategy for a new venture, or another project of this caliber. A Thesis or Honor’s Thesis may compose part of this Honor’s Capstone course.

*Prerequisite(s):* senior status, 3.6 GPA or better through the junior year in major; all courses specified by the project adviser.
MG 4603 Technology Management—Internship and Service

3 Credits This course provides undergraduate students with the opportunity to learn by working in the field under faculty supervision. This course exposes undergraduates to relevant, state-of-the-art and best practices in modern technology management from the perspective of reflective involvement and interaction in the field. In addition, a service often may be a significant part of this course. The course occurs largely in the field. This course may be taken only once. A member of the TM faculty oversees this course; but other faculty members may be involved in directing specific field assignments. This course is open to all undergraduates. Admission for BTM majors requires the permission of the Director of the BTM Program. Non-BTM majors must also obtain permission of their adviser as well that of the BTM director.

Note: This course currently may be applied only in addition to the 128 credits required for graduation from the BS in BTM Program.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 4904 BS Thesis in Business and Technology Management

4 Credits BTM students who earn an overall 3.0 GPA and a 3.4 GPA or better in technology management courses through their junior year of study qualify for an optional thesis. They are advised to meet with the Department Head or BTM Program Director in advance of completing their junior year. Before registering for the BTM Thesis, the student must find a Technology Management Department faculty member agreeing to serve as thesis adviser and then receive the Department Head’s approval in writing before proceeding. BTM Thesis students are permitted to replace either the Honor's Capstone Project I MG 4514 or Honor's Capstone Project II MG 4524 with MG 4904. This course cannot be repeated.

Prerequisite(s): Overall 3.0 GPA and a 3.4 GPA or better in MG courses through their junior year.

Note: TM Department Chair approval.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 5050 Probability and Managerial Statistics

0 Credits This course starts with the basic concepts of random phenomena and goes on to advanced applications of statistics relevant to managers. Topics include probability theory, discrete and continuous probability variables, sampling, measures of central value and dispersion, hypothesis testing, statistical inference, quality control, analysis of variance, regression, correlation and nonparametrics. The course emphasizes application of concepts.

Note: No credit is allowed toward any graduate degree program administered by the Department of Technology Management. This course is Pass/Fail only.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6013 Organizational Behavior
3 Credits Introduction to theory, research and practice to better understand human behavior in organizations. Topics include motivation and job satisfaction; decision making; group dynamics; work teams; leadership; communication; power, politics and conflict; organization culture, structure and design; impact of technology; management of work stress; organizational change and development; and career management. Analysis of organizational behavior problems by self assessments, case studies and simulations.

Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6043 Innovation Management in Money, Banking and Financial Markets

3 Credits This is an intensive course that examines the critical management issues of the management of financial institutions. The principal focus of the course is on interplay between the economic and technological developments in the management of modern financial institutions.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6073 Marketing

3 Credits This course covers marketing concepts, processes and institutions. Topics: Positioning, segmentation and product-life cycles. Integration of marketing with new product planning, design and development. Strategies for technology-based products, services and processes. Market research, consumer behavior, advertising, promotion and sales. The special character of governmental and international markets.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6083 Economics

3 Credits The course examines the fundamentals of microeconomics needed by managers. Topics: Demand theory (theory of the consumer) including models of demand, demand elasticities and demand forecasting. Supply theory (theory of the firm) including diminishing returns, profit-maximizing production levels, labor/capital tradeoffs, and long-run vs. short-run issues. Market structures and how they affect optimal production and profit levels. Positive and negative externalities and government intervention including regulation, tariffs and subsidies. Selected applied topics. All topics are presented with examples that emphasize managerial applications.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6093 Accounting and Finance

3 Credits The course covers elements of accounting and finance of importance to managers. Topics: Analysis of principles and practices of the finance function. Financing methods for internal and external ventures and innovations; capital budgeting; R&D portfolio analysis. Contrast of strategic perspectives emphasizing innovation and development with those emphasizing short-term return and investment.
MG 6103 Management Science

3 Credits  This course introduces major concepts and methods associated with Management Science, which deals with the application of quantitative modeling and analysis to management problems. Students learn to employ important analytical tools, to determine the assumptions used, and to recognize the limitations of such methods. The course discusses methods of linear and nonlinear programming, queuing, decision analysis, simulations and game theory. The course also introduces modeling with spreadsheets.

MG 6113 Career Management

3 Credits  This course integrates theory, research and practice pertaining to careers in organizations, particularly as they change through the life span. It examines careers from the perspectives of both the individual and the organization, including topics such as career-stage models, organizational entry, early career development, mid-career transition, career change and career issues for women. The course develops greater understanding and insight into one’s own career growth and development through the use of career-assessment techniques and standardized instruments for self-evaluation.

Corequisite(s): MG 6013 or instructor’s permission.

MG 6123 Human Resource Management

3 Credits  This course introduces the broad range of human resource functions and their organizational role. It addresses issues in managing people that have an impact not only on HR professionals but also on line managers. The course is divided into four modules: (1) an overview of HRM from a strategic perspective; (2) the management of human resources, including recruitment and selection, performance management, compensation and benefits, training and career support; (3) human resource challenges, including diversity, procedural justice and ethics, collective bargaining and managing change and innovation; and (4) professional roles in HRM.

Note: Distance learning available.

MG 6133 Labor Relations

3 Credits  This course introduces labor relations from various perspectives in both union and nonunion organizations. Topics include labor movement history; the current state of the labor movement; labor statistics; labor laws and practices; union organizing; negotiating; economics and labor unions; contract administration; achieving cooperation; grievances; labor and employment arbitration; employee discipline; engineering and professional unions, public sector unions; global aspects; and the future for unions.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6143 Conflict Management**

3 Credits This course investigates the nature and meaning of conflict in professional and technical organizations and in society. It analyzes the design of conflict avoidance and mitigation programs. Alternative dispute resolution modalities are presented and demonstrated. Students learn strategies to build successful relationships on an ongoing basis, and how to build skills around collaborative conflict resolution.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6153 Leadership and Team Development**

3 Credits This course focuses on the essential role of multifaceted leadership in diverse organizational settings, especially those utilizing technology. Students learn the nature of leadership and its relationship to team development and organizational effectiveness. The course broadly surveys theory and research on leadership and teams in organizations. Students learn a hands-on approach involving experiential learning and case analyses. Working in teams, students are required to participate actively.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6163 Job and Workplace Design**

3 Credits This course examines theory, research and applications of job and workplace design. Presented from an interdisciplinary perspective, the course shows how job design influences attitudes and work behavior within organizations. Students learn diagnostic tools for measuring and evaluating jobs and the psycho-social aspects of the workplace environment, as well as the principles of work redesign. Topics include the influences on work design by innovations in information technology, modern manufacturing, virtual work arrangements and open office systems; design and support of effective work teams; reengineering and total quality management; and privacy and communication in the workplace.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6173 Performance Management and Reward Systems**
3 Credits Students learn to create performance-appraisal systems that include theoretical and applied issues. Topics include coaching and feedback; team settings; multi-source feedback and selfratings; executive performance; and improving evaluations. The course examines the role of compensation, benefits and other rewards in attracting, retaining and motivating employees, including technical and professional personnel.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6181 Talent Management

1.5 Credits In this survey course, students gain a knowledge and understanding of the strategies and range of processes, methods and tools that organizations use in effective Talent Management programs. The focus is on developing and managing leadership talent and on Talent Management practices for general management, professional, technical and other positions. Topics include identifying and competing for critical talent pools; alignment and integration of HR practices; recruiting and employment branding; identifying, selecting, developing, reviewing and managing leadership talent; retention and recognition strategies; and career paths and career planning.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6191 Coaching in Organizations

1.5 Credits This course focuses on the role of coaching in organizations as part of a talent-management program to develop human resources. Students gain an understanding of the definition, theoretical basis, functions and models of coaching. Topics: How coaching is linked to the adult development lifecycle and the range of contexts in which it is applied. How coaching is used in leadership development as well as performance management, the multicultural aspects of coaching and the access minorities have to coaching. The course provides a familiarity with different coaching tools and instruments as well as how leading organizations use coaching in their talent management programs. Issues related to certification as a coach are addressed.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6201 Consulting in Organizations

1.5 Credits This course provides a practical orientation to consulting in organizations within an academic framework. The course prepares students from a variety of disciplines for roles as internal and external consultants by building knowledge and skills to successfully take a client and project from entry through termination and evaluation. Each student is required to take a project from conception to presentation. This project gives students an in-depth understanding of the details and issues that consultants need to address.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6211 Outsourcing: A Human Capital Strategy
1.5 Credits This comprehensive course prepares students from a variety of disciplines with the knowledge and skills necessary for a “make or buy” decision when considering outsourcing human capital. Topics include strategic implications, financial aspects, project management, internal consulting, metrics, legal considerations, development of an effective template RFP (request for proposal), internal communication details, and management of the vendor/provider relationship.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6223 Staffing Organizations

3 Credits This course examines the design and management of successful staffing practices used to build, deploy and retain a quality workforce to achieve organizational effectiveness and individual job satisfaction. Topics include staffing strategy; human-resource planning and workforce diversity; job analysis; recruitment; hiring methods; the reliability and validity of employee-assessment methods; and retention management. The course reviews psychological theories of personnel assessment and integrates legal issues pertaining to staffing practices.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6233 Training in Organizations

3 Credits This overview of numerous forms of training and related learning activities found in the modern workplace includes management development, technical training, career planning and mentoring. The course focuses on training as both an asset to the organization and a necessity for delivering goods or services that customers value. Topics include needs analysis, preparation of employees for jobs, training program design, traditional training methods, computer-based methods, development, implementation and evaluation of training, targeting various groups with special training needs, and management development.

Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6243 Organization Development

3 Credits This course surveys theory, research and applications related to the process of managing planned change in organizations. Organization development (OD) encompasses a variety of interventions and techniques, including strategic management sessions, team building, organizational climate studies, career development and job enrichment. The course addresses the practical application of group, inter-group and individual changes; planned structural revisions in formal organizations; and the dynamics of organizational change processes. Experiential techniques are emphasized.

Corequisite(s): MG 6013 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6253 Seminar in Organization and Career Change

3 Credits This course explores organizational restructuring, including downsizing, reengineering, delayering, mergers and acquisitions, and focuses on the impact of such change on professional and managerial careers. The course emphasizes current organizational and individual management practices in coping with rapid structural, cultural and technological change in the work environment. Experts from the private and public sectors and from consulting firms address these management practices.

Corequisite(s): MG 6013 or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6263 Human Resource Information Systems

3 Credits This course introduces the design, selection, implementation, enhancement and operation of human-resource information systems (HRIS), a computer-based tool that allows the efficient entry and updating of employee-related information. The focus is on the design and use of HRIS to facilitate the objectives of HR functions and of the organization. Students participate in a “hands-on” experience with the design of prototype simulations and database programming systems used to solve common HR problems and efficiently manage employee information.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6271 Managing Human Resource Technology in Organizations

1.5 Credits This course examines factors critical to the effective organizational adoption and use of technology in human-resource applications. Topics include project management; HR data and process standardization; organizational governance; the unique security requirements of HR data; metrics; and HR process and technology outsourcing. By understanding these issues and how organizations can address them, students improve their ability to plan and to implement effectively HR process reengineering and HR technology.

Corequisite(s): MG 6123 or instructor’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6283 Web-Based Human Resource Management

3 Credits This course surveys the effective use and application of Internet and Intranet technologies for HR functions. Topics include employee self-service and online recruiting as well as software that handles peer reviews, applicant tracking, performance management, succession planning and benefits administration. Issues include best practices in using Web technology for HRM; creating websites to achieve organizational goals; determining HR information to include in an organization website; impact of Web technology on organization design; evaluating privacy and security issues; and developing a vision and a plan for utilizing Web technology in HRM.

Corequisite(s): MG 6123 or instructor’s permission.
Note: Distance learning available.
MG 6293 Managing Technical Professionals

3 Credits This course provides a survey of research and practice focusing on the effective management of technical professionals, who have come to represent a significant segment of the labor force. The success of organizations today is largely a result of the knowledge and skills applied by their technical professional employees. The effective management of such a work force has been one of the most critical problems faced by organizations that depend on their contributions. This course closely examines research and case studies that examine various management techniques to improve the utilization, development and motivation of technical professionals for achieving high levels of performance, innovation and creativity.

Prerequisite(s): MG 6013 or instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6303 Operations Management

3 Credits This course covers analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods, and case studies and computer usage.

Also listed under: MN 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6313 Organization Theory and Design

3 Credits Introduction to theories of organizations including structure, design and culture. Provides an understanding of how organizations work and their interrelationship with the external environment. Examines the process by which managers select and manage aspects of structure and culture to achieve organizational goals. Topics include characteristics of bureaucracy, adhocracy, sub-optimization, human dynamics and informal systems; influence and control systems; management of technology; and planned change. Examination of organizations through research and case studies.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6321 Global Human Resource Management

1.5 Credits This course is an overview of human-resource management practices in today's global work environment. Topics include international/ socio-cultural diversity; key characteristics of select countries' international business behavior; international strategic alliances; identification, recruiting and selection of international personnel; training and development of expatriates and home-country nationals; evaluation and coaching of employees in international organizations; intercultural skills acquisition for the line manager and human resources professional; team-development strategies; and design of practical language learning tools for the HR professional and the line manager.
Corequisite(s): MG 6123 or instructor’s permission. Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6333 Research Methods**

*3 Credits* This course introduces theories and techniques related to research methods applied to organizations. It also provides an understanding of why and how organizational research is carried out. The focus is on analyzing organizational problems and using research as a problem-solving tool. Topics include problem definition, theoretical framework, hypothesis development, research design, experimental designs, measurement, data-collection methods, sampling strategies and preparing research proposals. Students develop a research proposal they apply to a problem of interest.

*Prerequisite(s): MG 5050 or undergraduate statistics course.*

*Note: Distance learning available.* Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6353 Quality Management**

*3 Credits* Companies have found that focusing on quality and overall customer satisfaction as a primary objective of manufacturing and service operations is a proven competitive weapon. This course examines the concepts and methods to building quality into the management process. Total quality management (TQM) and similar approaches are covered through readings, case studies and examples.

*Also listed under: MN 6353.* Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6463 Supply Chain Management**

*3 Credits* This course introduces supply-chain management and covers its qualitative and quantitative aspects. The underlying objective is to: (1) introduce students to the standard business concepts (and associated terminology) involved in the retailing and supply-chain management; (2) develop skills in understanding and analyzing retailing, marketing, logistics, operations, channel management and allied issues and the interactions between them; and (3) examine and discuss the important role played by technology and integration at various points in the supply chain.

*Also listed under: MN 6463.* Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 6503 Management of Information Technology and Information Systems**

*3 Credits* This course is for managers who need to understand the role and potential contribution of information technologies in organizations. The course focuses on different information technologies and their applications in managing business-critical data, information and knowledge. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; building, implementing and managing IT applications; and emerging issues such as intelligent systems, business-process re-engineering, knowledge management and group support systems.
MG 6523 Telecommunications Policy

3 Credits This course looks at relationships among the development of the telecommunications industry and national growth and examines the development of telecommunications policy issues as well as policy-making organizations. The course analyzes the major issues that affect the telecommunications industry and commerce and society. The options and opportunities afforded by recent regulatory and policy issues are examined.

MG 6543 Economics for Information Sectors

3 Credits This course in applied competitive strategy draws upon recent experiences associated with the impact of information technology upon diverse industries. Students master a basic understanding of the economic and competitive implications of information technology. Students gain competence in analysis by understanding how the availability of information (through technology or otherwise) affects the basic strategic options available, and how firms and industries are likely to be affected. Students are introduced to the often poorly-structured process of evaluating the economics of potential systems innovations. Students then can participate in strategic-systems planning from a managerial point of view.

MG 6553 Telecommunications Management I

3 Credits This course introduces the fundamentals of modern telecommunications and networking for current and future managers. Topics include basic concepts such as components of data communication, data transmission, Open System Interconnection (OSI), TCP/IP and other models, data link and network layers and local area networks (LANs). The course expands technical knowledge and discusses related managerial issues.

MG 6563 Telecommunications Management II

3 Credits This course explores advanced issues and trends in modern enterprise networking. The course also examines the implications of such developments in the business environment and the infrastructural needs of organizations and clusters of organizations; reviews ramifications of the TCP/IP revolution leading to commercialization of the Internet/World Wide Web; discusses the network infrastructure required to implement Intranets/Extranets, electronic commerce and interorganizational business communication and collaboration generally; evaluates emerging technologies (such as electronic payment systems, corporate digital libraries, push technology, multicasting, firewalls and digital signatures); and deals with the implications of Internetworking, such as digital cities, smart buildings, distance learning, telecommuting and teleconferencing.

Prerequisite(s): MG 6553.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6603 Management of New and Emerging Technologies

3 Credits This course surveys and explores the business implications of selected new and emerging technologies with the potential to change business practices and create new industries. Technologies discussed include new Internet architectures, Wikis, Open Source, security issues, new Web services, social networking and Web 2.0. This course is for the manager who is interested in staying current with, and learning about, new technologies for use in business. No specific engineering background is required. A variety of reference texts, journals, case studies and websites is used.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6643 Management and the Legal System

3 Credits This course discusses the impact of the legal system on corporate strategy, managerial decisions and planning processes. Issues covered include protection of intellectual and technological properties; consumer, contract and commercial laws; employer liability; negligence and risk-management from legal and corporate viewpoints; and constitutional and regulatory aspects of conducting business.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6703 Operations Management for knowledge-Based Enterprises

3 Credits This course focuses on developing a deeper understanding of the role that operations management plays in determining business strategy and in developing competitive advantage. The primary emphasis is on developing and effectively managing operations in knowledge-intensive enterprises. Students discuss the operational design and managerial implications when the emphasis of the operations group is more on knowledge management than on managing production and facilities; managing the effective integration of technology, people and operating systems; understanding the complexities and challenges of operations management; meeting the challenges of developing and managing supply-chain networks; and understanding the critical role of technology in developing an organization’s operational capabilities.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6753 The Media and Entertainment Sector: Structure, Organization and Management

3 Credits This course introduces the various industries that compose the media sector and outlines the major issues confronting these industries as they grapple with incorporating digital-based and mobile innovations into their businesses. Discussions cover the structure of industries within the sector and how managers are recalibrating their business models and redesigning their organizations to compete in the current media and entertainment sector. Other issues covered include the new media industry as a catalyst for change; the transformation of traditional content-intensive industries, such as the motion picture business, the book publishing business, the newspaper business and the music industry; and the newly defined role of users and customers. Participants read case studies and articles and access other relevant materials in electronic and print format. Emphasis is on interactive discussions in class and on projects developed by individual participants and teams of participants.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 6763 Managing Emerging Technologies in the Media and Entertainment Sector

3 Credits This course focuses on selected emerging technologies that are changing the nature of competition in the media sector. The dynamic relationships involving changing technology, business processes and management response are viewed in light of new digital platforms and applications, standards development, as well as legal and legislative initiatives. Topics include intellectual property rights and digital rights management; content-on-demand; and the management, archiving and preservation of digital content.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6773 Advanced Trends in Innovation and Technology in the Media and Entertainment Sector

3 Credits This course explores important trends and issues with a significant impact on managing technological innovation in the media sector. The course covers a range of topics, which may vary year to year and which serve as a culmination of the ideas and issues discussed in the MOTIME track. Participants develop projects that reflect their interests in particular aspects of the sector. Examples are redefinition of the notion of convergence; the intersection of design, content and technology; and the globalization of the media industry.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6903 Managerial Decision Making for Information-Intensive Businesses

3 Credits This course introduces managerial decision making and strategies, emphasizing information-intensive businesses and the fast-changing environment in which they compete. This course explores such issues as competing in both the digital and physical spaces, technology as an enabler of change, the role of the professional manager and managing in an increasingly globalized environment.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 6933 Information Technologies, Systems and Management in Organizations

3 Credits This course is for managers who need to understand the role and potential contribution of information technology (IT) within organizations. The focus is on information technology and its business applications. The course concentrates on the current state of IT in organizations; challenges and strategic use of IT; IT infrastructure and architecture; the technical foundation of IT; building and implementing organization information systems; and emerging issues in IT, such as intelligent systems, business process re-engineering, knowledge management and group support systems. Course format is interactive with concept presentation followed by open discussion of real-world applications of IT and business cases.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7173 Enterprise Data Systems
The course addresses modern issues of large-scale information and knowledge management through the design, development and implementation of different kinds of database technologies. The course introduces and elaborates data modeling through relational models, SQL applications, database architecture, different types of database-management systems, and data integrity and administration. The course introduces emerging database technologies, such as distributed Internet-based databases, distributed client/server databases, multidimensional databases, groupware, data warehousing, and data mining for decision support.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7183 Strategy for the Modern Enterprise**

3 Credits This course provides an overview of strategic decision making for the modern enterprise. It introduces general management perspectives of strategy, competitive strategy, emerging analytical characteristics of strategy, and current innovation and global dimensions of strategy. The course concludes with an integrative approach for strategic decision making. Such an approach is geared to a business environment that is increasingly fast-paced, complex, knowledge-intensive, global and changing continuously.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7203 Intercultural Dimensions of Global Management**

3 Credits This course focuses on the critical intercultural dimensions of global management. Topics covered include identifying key culture-related factors essential for effective global management, communicating across different cultures, building effective trans-cultural organizations, developing capable cross-culture managers and leveraging cultural diversity.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7503 Electronic Business Management**

3 Credits This course investigates the management implications of electronic business. Topics include: (1) accelerated new product development; (2) impact of technology on the value chain: the changing role of intermediaries; (3) electronic commerce: business models and strategies for survival of general lifestyle; (4) implications of “being wired”; and (5) business applications involving collaborative communication, computation and teamwork. The course material is dynamic and Internet-based, reflecting the nature of change in electronic commerce and the IT industry, and the potential implications of electronic business for managers. Students work on a project that requires following developments in the business and IT press, interviewing managers and product developers and simultaneously testing and discussing current developments in the e-commerce market space. Classes use the case method, and a high level of class participation is expected.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7653 The Retailing Industry: Structure, Organization and Management**

3 Credits This course introduces the emerging structure of the modern retailing industry and effective retailing management. Students investigate how key firms in the modern retailing sector are managed and how pacesetting firms are organized and
structured at both the strategic and operational levels. The course covers physical and internet-based retailing.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7663 Managing Technological Innovation and Emerging Technologies in the Retailing Industry**

3 Credits This course introduces technological innovation and emerging technologies in retailing. The focal point is the effective management of technological innovation in modern retailing. Also discussed are the role of technology platforms and applications, technology development and use, and the relationships between technologies and business processes.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7671 Global Retailing and Supply Chain Management**

1.5 Credits This course focuses on current theory and practice in global retailing and supply-chain management and the link between globalization and supply-chain management. The course examines the flow and transformation of goods from the raw-material stage to the end user. Another focus is the globalization of retailing, which has triggered a range of supply-chain innovations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7693 Managerial Analytics**

3 Credits This course focuses on the use of “analytics”—a fast-growing element in modern management—for achieving more effective operations and heightened competitive advantage. The course provides a managerial overview of current deployment of a diverse range of analytics—internally-oriented and externally-oriented. The course also identifies the impact of analytics on a firm’s performance and explores their strengths and weaknesses. The course presents best practices of analytics from a range of industries, including retailing, hospitality, financial services, consulting, healthcare and logistics.

Pre/Co-requisites: MG 6083 and MG 6093.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 7703 Entrepreneurship**

3 Credits This course focuses on entrepreneurship and venture creation as key engines for wealth creation and successful business strategy in the modern, innovation-intensive, high-tech economy. The course deals with key issues such as: (1) assessing attractiveness of opportunities; (2) launching a new venture; (3) nurturing, growing and entrepreneurial venture; (4) obtaining the necessary financial, human and technology resources; (5) managing the transition from a small entrepreneurial firm to a large, sustainable, professionally managed but still entrepreneurial corporation; and (6) being an entrepreneur and promoting entrepreneurship in a large corporation.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 7713 The Bio-Pharma Sectors: Structure, Organization and Management

3 Credits This course introduces effective management in the modern bio-Pharma sectors. Students investigate how key bio-Pharma firms are organized and managed at both the strategic and operational levels. Particular attention is paid to various forms of technology and innovation management in the bio-Pharma arena.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7723 Managing Technological Innovation and Emerging Technologies in the Bio-Pharma Sectors

3 Credits This course explores the two major routes for discovery and manufacturing: the “chemical” route and the “biological” route. Students receive a blend of conceptual overviews, essential technical and scientific basics, competitive, and the regulatory and management implications of the developments, cases and industry examples that are studied.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7743 Advanced Trends in Technology Management and Innovation

3 Credits This course explores several emerging trends in the technology management and innovation arena in the past decade. These trends include the advent of digital-based innovation in the late 1990s, which has affected profoundly how many firms conduct business; the effect of the crash of the NASDAQ in March 2000 and the September 11 attack that affected corporations, which then had to operate within major economic and creative constraints; the development of the concept of networks as it relates to a firm’s organization and strategy; the development of the wireless technology platform and its effect on technology innovation; and the development of a new innovation paradigm that suggests a relationship between information technology, creativity and business practices. The course emphasizes classroom discussions and team-based and individual projects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7811 Selected Topics in Networking and Information Technologies

1.5 Credits This course explores in-depth selected modern networking and information technologies. Specific topics vary year to year. Examples are mobile communications, IP telephony, enterprise data systems. The course builds on previous TIM courses. Students receive a solid technology grounding in a learning context that also emphasizes how these selected technologies affect markets, industries, providers, integrators and users. The course’s technical content is supplemented by case examples and guest speakers.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7841 Negotiation in Technology Intensive Sectors
1.5 Credits Negotiation is the art and science of creating good agreements. This course covers the science of negotiation by discussing and applying theories of negotiation. The art of negotiation is learned by practice. Students develop the art by negotiating with each other in realistic cases. A wide variety of negotiation applications is covered, including one-time and repeated negotiation, single and multi-issue negotiations, and two-party and multiparty bargaining. The class emphasizes negotiations in technology-intensive environments. This class is taught using the case method. Many examples are cases that students negotiate with each other. Students’ grades are based on their performance in these negotiations and on class participation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7851 Leadership

1.5 Credits Leaders set a vision, communicate it well and influence and inspire others to achieve their vision. However, leaders face many challenges in effectively meeting these objectives and can be aided or handicapped by effective and ineffective methods. This course develops the student’s leadership approach by analyzing individual styles, understanding their impact and then enabling each student to create the right leadership style. This course addresses fundamental leadership issues and frameworks, drawing on current organizational research, but most of all it provides students with ways of getting insights on their own leadership style. The course emphasizes hands-on experience and focuses on experiential learning. Course objectives include assessing leadership styles; developing leadership skills; and understanding the role of leadership coaching in managing teams.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7861 High-technology Entrepreneurship

1.5 Credits This course focuses on entrepreneurship as a critical engine for wealth creation in the high-technology, innovation-intensive economy. It covers such key issues as: (1) assessing attractiveness of opportunities; (2) launching a new venture; (3) obtaining the necessary financial, human and technology resources; (4) managing the transition from a small entrepreneurial firm to a large, sustainable professionally managed but still entrepreneurial corporation; and (5) being an entrepreneur and promoting entrepreneurship in a large corporation.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7871 Intellectual Property for Technology and Information Managers

1.5 Credits This course focuses on the role of intellectual property (e.g., patents, trade secrets, copyrights and trademarks) as a major element in modern technology and information strategy. Relevant concepts and case studies are used, with examples representing classical and digital innovations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7873 Managing Intellectual Property and Intellectual Capital
3 Credits Intellectual property and intellectual capital constitute major strategic and financial assets of a modern business and can be employed to protect existing products, services and business methods and to accelerate development of new products, services and business methods. Firms can leverage intellectual property and intellectual capital to enhance their competitiveness, value and profitability. This approach is true in the physical world and in the online world of the Internet and e-business (where traditional principles of Intellectual Property Rights are often stretched and may need reinterpretation and even modification). Intellectual property is becoming increasingly complex as emerging digital technologies advance. This course is a broad and full survey of the main areas and issues associated with managing intellectual property and intellectual capital. The course concludes by examining how firms can best manage their intellectual capital.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7881 Modern Supply Chain Management: Integration Through Technology

1.5 Credits This course introduces the role of information technology in supply-chain management. Both qualitative and quantitative aspects of supply chain management are covered. Students discuss and analyze articles pertaining to leading-edge research and management thought. The underlying objective is to prepare participants to develop useful skills for analyzing technology, marketing, logistics, operations and broader channel management issues. Classes use the case method. A high level of class interaction is expected.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7883 Information Security and Privacy: Systems

3 Credits This course centers on management issues in information security and privacy in systems planning and development. Students learn to take a risk-based approach to integrating security into the planning and development of information systems at organization and enterprise levels. Topics covered: Risk analysis and management; integrating security into system design processes; security policies; legal, ethical, and privacy issues; and security in the software design process.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7891 Special Elective Topics for EMOT and EIM

1.5 Credits This course covers selected key emerging trends and issues in the MOT and IM domains. The course involves discussion with industry leaders and specialists from business, government and academia. The course includes topical treatment of technologies, markets, business practices, government regulations and the relationships among them.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7953 Global Innovation

3 Credits This course focuses on global technology-enabled innovation. Topics covered include accessing global sources of innovation, coordination and organization of activities worldwide, new product development globally, the role of revitalized global R&D, growing prominence of IT and e-Business in global innovation and the role of alliances and linkages with customers, suppliers and other third parties.
MG 7963 Modern Financial Institutions and Their Competitive Environment

3 Credits This course focuses on managing modern financial enterprises, innovation and technology management in these organizations, and the risk-return tradeoff from a financial institution perspective. It deals with the theory and practice of financial institutions by analyzing the regulatory, technological and competitive factors that define the dynamics of this rapidly changing industry. Knowledge in this course is developed primarily with a mix of textbook reading and discussions of concepts in real business contexts through case studies. The objective is to provide technology managers with a firm knowledge of the normative consequences on financial-management decision making to create shareholder value.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7971 Financing for Value Creation

1.5 Credits This course focuses on creating strategies and financial skills required by managers of entrepreneurial and innovative firms at various stages of evolution: from new, stand-alone entrepreneurial ventures to innovative, technology driven projects of established corporations.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 7983 Managing Technological Innovation and Emerging Technologies in Financial Services

3 Credits This course, for current and future managers, introduces emerging information technologies and their applications in financial services industries. It covers three major financial services industries: banking, investment and insurance. Students develop a deeper understanding of concepts and analyze real-business context through case studies. The course provides adequate technical knowledge and discusses related managerial issues in depth.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8203 Project Management

3 Credits This course examines the management of technology-based projects, ranging from individual research and development to large scale and complex technological systems. Topics: Feasibility and risk analyses, Project selection and portfolio optimization. Functional and administrative structures, coordination and scheduling of activities, personnel planning, negotiations and contracts, cost estimation, capital budgeting, cost controls, effective matrix management.

Also listed under: CE 8203.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 8213 Information Security and Privacy for Managers

3 Credits This course addresses the principles of information security and privacy from a risk management perspective. Students learn why security is important to the enterprise and the potential impacts of security and privacy failures. Attacks will be discussed in terms of the goals of the attackers, their capabilities and the concept and high-level technical aspects of the attack’s operation. Each of the leading security controls is discussed in terms of the kinds of attacks it is meant to thwart, the concept of the defensive operations of both technologies and related processes, and management issues concerning the control.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8253 Project Management for Construction

3 Credits The course covers topics specific to developing and coordinating large projects, including organizational structures, management functions, pricing and estimating project costs, bidding and contracting, risk allocation, scheduling, time and cost control, labor relations, quality management and project life-cycle activities.

Also listed under: CE 8253
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8263 Construction Cost Estimating

3 Credits This course covers estimating and cost control from the viewpoint of contractors and construction engineers; details of estimating with emphasis on labor, materials, equipment and overhead.

Also listed under: CE 8263
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8273 Contracts and Specifications

3 Credits This course covers principles of contract law as applied to the construction industry and legal problems in preparing and administering construction contracts.

Also listed under: CE 8273
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8333 Information Security and Privacy: Operations

3 Credits This course focuses on management issues related to information security and privacy in operations. Students design security programs and processes that foster strong lifecycle security. Topics addressed include security organization structure, security program models, economics of security, security management of operations, incident response, contingency planning, compliance, security considerations of outsourcing and global operations, and security audits.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 8573 Managing Cleantech and Renewable Energy Innovation

3 Credits This course focuses on the rise of cleantech/renewable energy (aka sustainability green, etc.) as a possible major locus of Twenty-First-Century innovation. The course deals with the diverse ways innovation is taking pace in the broadly defined cleantech arena. The course covers technology management in several distinct cleantech/renewable technology regimes and varied company venues (e.g., small, medium size and large firms). The encompasses local and global modes of cleantech/renewable energy innovation. The course requires single-firm, multi-firm and “systems” perspectives for understanding with cleantech/renewable energy innovation. The course employs both intellectual and practitioner-oriented orientations. Throughout, this course maintains a primarily managerial perspective. Students are often asked to assume the role of managers charged with the responsibility of designing, supporting and implementing a cleantech/renewable energy innovation strategy. An overarching concern is on discovering ways to improve the effectiveness of cleantech/renewable energy innovation and technology management and, where appropriate, entrepreneurship.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8603 Financial Planning and Control

3 Credits This course examines the latest and most relevant approaches for modern financial planning and control. Specific examples of best practices are studied. Topics covered include an overview of financial planning and control, operational-level financial planning and control, management reporting, forecasting, the application of technology and analytics, the relationship between strategic planning and operational-level financial planning and control, the challenges of implementation and emerging trends in the financial planning and control area. The course emphasizes trade-offs and balance, e.g., a need for financial planning and control and a desire to also have employee empowerment in modern firms.

Prerequisite(s): MG 6093.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8633 Market Research

3 Credits This course deals with the role of market research in modern firms and with the ways market research can help to make business decisions. The focus is on how market data and information is gathered, analyzed and used. Topics include experimental and questionnaire design, use of various analytical tools, interpretation of findings and development and execution of plans based on market research results. The strengths and drawbacks of various techniques are examined.

Prerequisite(s): MG 6073.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8643 New Product Development

3 Credits The dynamics of technology and the pressures of competition drive enterprises to make their product development and production processes strategically more effective and economically more efficient in time and cost. The course deals with the state of the art in new product activities for services and manufacturing firms and examines in-depth the marketing, technology and manufacturing technology linkages.
Also listed under: MN 8643.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8653 Managing Technological Change and Innovation

3 Credits This course focuses on how to employ a dual perspective to manage technological change and innovation effectively. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provide essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires effectively managing change to assure the commitment of all stakeholders. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provide key insights to manage effectively the process of innovation and its impact on an enterprise. The course explicitly considers a firm’s need to manage and inspire people so they can communicate and innovate effectively.

Also listed under: MN 8653.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8663 Technology Policy

3 Credits This course focuses on the macro-environment that influences and is relevant to technology decision making, strategy and innovation in firms, government agencies, non-profit institutions and other organizations. Primary concerns include introducing effective approaches to analyze and evaluate societal-wide factors that influence innovation; to assess various attempts and policies to stimulate innovation in a city, region, nation or globally; to explore the role of technology and innovation in diverse managerial, economic and social contexts (e.g., advanced economies, rapidly emerging economies and Third World economies); to examine the relationship between business-government and NGOs in promoting and sustaining innovation; to explore the impact of global rivalry and global cooperation in the technology and innovation arena; and to understand the place of technology and innovation in the post-Cold War era and in the early 21st century.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8673 Technology Strategy

3 Credits This course examines in-depth the strategic technological decisions that a general manager faces. From entrepreneurial start-ups to established companies, in dynamic as well as mature environments, a firm must create a conscious process of formulating and implementing a technology strategy to serve its business interests. Such a strategy guides investments in research and development, selection among and timing of alternate technologies, organization and communications, formation of alliances and funding of ventures.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8693 Special Topics

3 Credits This course requires Individualized readings on special topics assigned by instructor.
**MG 8703 Introduction to Modern Information Technology Strategy**

3 Credits This course deals with applied competitive strategy. Students completing this course master a basic understanding of the competitive implications of information technology and the strategies for using information technology in business. This competence in analysis is arrived at through understanding how availability of information (through technology or otherwise) affects the basic strategic options available, and how firms and industries are likely to be affected. In addition, students are introduced to the process of evaluating potential systems innovations. They then are able to participate in strategic and systems planning from a managerial point of view.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8711 Introduction to Entrepreneurial Finance**

1.5 Credits This course briefly introduces the financial requirements of entrepreneurial ventures and different sources of finance available to entrepreneurs. The course presents fundamentals for assessing various entrepreneurial financial strategies. The program will consider offering this course only at the request of other departments.

*Note: This course is not open to MSM and continuing MBA students.*

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8713 Entrepreneurial Finance**

3 Credits This course focuses on the financial requirements of entrepreneurial ventures and on different sources of finance available to entrepreneurs. The course develops an understanding on how to assess various entrepreneurial financial strategies. The course also examines the unique roles in the entrepreneurial finance arena of such factors as retail banks, investment banks, VCs, angels, internal sources of capital, and incubators.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 8721 Introduction to Managing Growing Enterprises**

1.5 Credits This introductory course deals with a critical challenge that potentially confronts all successful entrepreneurial small- or medium-size firms: how to sustain and accelerate major growth. At some point in the life of all growing enterprises, a firm usually must change. This course introduces several ways a growing firm can transform itself from a small to a larger enterprise. The course explores how such companies can maintain the benefits of an entrepreneurial commitment and spirit while obtaining needed skills associated with professionally managed larger firms. The program will consider offering this course only at the request of other departments.

*Note: This course is not open to MSM and continuing MBA students.*
MG 8723 Managing Growing Enterprises

3 Credits This course deals with a critical challenge that potentially confronts all successful entrepreneurial small or medium-size firms: how to sustain and accelerate major growth. At some point in the life of all growing enterprises, a firm usually must change. The firm no longer can operate on a scale that is small, possibly ad hoc and overly responsive. To adapt, the firm needs to exploit successfully its success in the marketplace and the future attractiveness of its innovative products and services. This course examines how a growing firm can transform itself from a smaller to a larger enterprise. The course focuses particularly on how companies can maintain the benefits of an entrepreneurial commitment and spirit while still obtaining needed skills associated with professionally managed larger firms. In this way, fast-growing firms can take advantage of innovation-based opportunities while scaling up.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8731 Introduction to Corporate Entrepreneurship

1.5 Credits Large firms require professional management. To innovate, however, large corporations often must also practice entrepreneurship. This course briefly introduces how large corporations nurture and sustain entrepreneurship.

Note: Not open to MSM, MSOB and continuing MBA students. The program will consider offering this course only at the request of other departments.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8733 Corporate Entrepreneurship

3 Credits Large firms require professional management. To innovate, however, large corporations often must also practice entrepreneurship. This course focuses on how large corporations nurture and sustain entrepreneurship and on how entrepreneurship is an integral part of a successful large firm’s strategy and structure today. This course examines forms of internal entrepreneurship, corporate venture capital, and the obtaining of entrepreneurial capabilities via acquisition.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8741 Introduction to Entrepreneurial Marketing and Sales

1.5 Credits This course introduces entrepreneurial marketing and sales and covers various topics about entrepreneurial marketing and sales. The program will consider offering this course only at the request of other departments.

Note: This course is not open to MSM and continuing MBA students.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8743 Entrepreneurial Marketing and Sales
3 Credits This course focuses on critical marketing and sales challenges facing entrepreneurial firms. The course examines an underlying theme of entrepreneurship: that successful innovative enterprises must deeply understand relevant markets and must effectively cultivate and reach those markets. Topics include market identification, segmentation, sales, overall market planning, niche and viral marketing, and customers as sources of innovative ideas.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8753 Information Technology: Systems

3 Credits This course prepares the student to be an educated consumer of information technology systems, thereby maximizing the strategic advantage of IT to an organization. Information technologies, architectures and products are categorized and analyzed with a view to develop and maintain the most favorable IT asset portfolio to carry out successfully business goals and strategies. Students learn techniques for making group decisions in assessing technology, outsourcing decisions, bidding on projects and negotiating contracts. Students also learn to manage a reliable, high-quality portfolio of information-technology systems, based on new insights into the relationship between the technology and business needs.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8763 Information Technology: Operations

3 Credits This course covers IT operations and services. Students learn to deliver reliable, high-quality IT services through an automated, optimized IT infrastructure and operation, based on new insights into the relationship between those services and business needs. Topics covered: IT governance, data center automation, infrastructure optimization, service management, application performance management, and security management.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8763 Knowledge Management

3 Credits Knowledge workers, employed primarily in professional and technical occupations, are increasingly becoming an important segment of the U.S. labor force. The success of innovative organizations today often results from the knowledge and skills applied by their professional and technical employees. Effective management of such a work force has become one of the most critical problems faced by organizations in the private and public sectors. Reflecting this problem, the course addresses issues relating to creating, sharing and applying knowledge in organizations. The course examines knowledge management from various perspectives, focusing primarily on the organizational, managerial and technological perspectives.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 8783 Managing Cloud Computing

3 Credits Many corporations and governments around the world are either planning or are in the process of migrating into a “Cloud”. Cloud computing as a technology is proliferating at a rapid pace, and as such, there are myriad definitions, architectures, and models that are being developed. Cloud is a significant part of information management, and business managers should become well versed in managing and leading this cutting edge technology. They need to clearly understand how
IT components such as virtualization, automation and security fit into and define a Cloud. This course provides a Comprehensive overview of managing cloud computing. The course starts by developing a comprehensive technology foundation and then deals with the economics of cloud computing by analyzing its benefits, risks and obstacles. The course then examines Virtualization, Automation, and Security, the three essential components of cloud computing. Specific case studies on private and public clouds are illustrated. The course concludes with the development of specific templates and roadmaps that help an organization migrate from managing traditional IT into a cloud based infrastructure.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9203 Seminar in Managing Knowledge-Workers in Innovative Organizations

3 Credits Knowledge workers, who are primarily in professional and technical occupations, now represent the most important segment of the U.S. labor force. The success of innovative organizations today results largely from the knowledge and skills applied by their professional and technical employees. The effective management of such a work force is one of the most critical problems faced by innovative organizations in the private and public sectors. This seminar closely examines theory and research and various management techniques to improve the use and development of knowledge workers in innovative organizations.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9213 Seminar in Information Systems Management

3 Credits This course provides PhD-TM students and those in other related fields with a perspective on modern information-systems methodologies, technologies and practices. State-of-the-art research on frameworks for analysis, design and implementation of various types of information systems is presented. Also covered are economic and strategic issues related to information technology; the emphasis is on research in organizational, inter-organizational and strategic settings. The course follows a seminar format, and students are assigned paper-based and Web-based readings. Student’s contributions are expected during class sessions, both as participant and, for one class, as moderator.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9223 Seminar in Business Process Innovation

3 Credits This doctoral seminar explores dimensions and issues pertaining to the technology-business process interface that are critical to superior performance in today’s modern networked corporations. Students discuss how technology has affected everything from common business tasks to complex and global supply-chain integration. Qualitative and quantitative aspects in these areas are addressed. The class also discusses articles on leading-edge research and management thought. The underlying objective is to expose the student to the rich and emergent literature in modern supply-chain management, technology integration and business model evolution. Major seminar themes include technology integration, product and process innovation, marketing, logistics, operations, IT and channel management issues in supply chains across various industries. The seminar emphasizes understanding the role of technology in the supply chain and its relation to business processes and innovation.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 9233 Seminar in Managing Technological Change and Innovation

3 Credits The objectives of this seminar are to familiarize students with the key viewpoints in the literature on technological innovation. Readings are selected to highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this body of literature set the stage for future research work in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9243 Technology Management and Policy

3 Credits This course focuses on the research related to macro-environment that influences and that is relevant to technology decision making, strategy and innovation in firms, government agencies, nonprofit institutions and other organizations. Primary concerns include introducing effective approaches for analyzing and evaluating societal-wide factors that influence innovation; assessing various attempts and policies for stimulating innovation in a city, region, nation or globally; exploring the role of technology and innovation in diverse managerial, economic and social contexts (e.g., advanced economies, rapidly emerging economies and Third World economies); the relationship between business-government and NGOs (non-government organizations) in promoting and sustaining innovation; the impact of global rivalry and global cooperation in the technology and innovation arena; and the place of technology and innovation in the post–Cold War era and in the early 21st century.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9253 Technology Strategy, Structure and Decision Making

3 Credits This course explores the most important and relevant theories and concepts related to technology strategy, structure and decision making. The emphasis is on understanding the useful application of such ideas for modern technology management and for designing effective scholarly research that deals with the strategic, structural and decision-making aspects of innovation and technology management.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9263 Strategic Marketing Seminar

3 Credits This course examines strategic marketing issues that face firms and industries from theoretical and empirical perspectives. The seminar looks at product design, positioning and strategy, distribution, sales force, design of the marketing organization, competition, market structure, problems of information, signaling and pricing, corporate reputation and branding, advertising and promotion, and recent advances in product and service development.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9273 Doctoral Seminar in Technology Adoption and Diffusion
3 Credits This seminar familiarizes students with the key viewpoints in the literature of technology adoption and diffusion. Readings are selected to highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this literature sets the stage for future research in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9283 Doctoral Seminar on Entrepreneurship

3 Credits This seminar familiarizes students with key viewpoints in the literature on entrepreneurship. Readings highlight the most important contributions to the literature by past and current academics. A critical analysis and review of this literature sets the stage for future research in this important management area.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9293 Seminar on Content Innovation

3 Credits Because the Internet has evolved to provide a robust technology platform on which to create content, the notion of what comprises content has expanded to include not only one-dimensional content, (print newspapers, books and music recordings, the core output of traditional media companies) but also multidimensional, nonlinear content that can reside in physical, digital or hybrid (physical and digital) spaces. The popularization and proliferation of this new content has affected profoundly the development of the creative industries (e.g., publishing, newspapers, video games, fashion and music) and thus significantly challenges managers. This seminar explores the evolution of content innovation and focuses on several major issues, including the restructuring of creative industries and related managerial challenges resulting from developments in content innovation; the impact of restructuring creative industries on the development of urban centers of creativity and technoculture, such as Silicon Alley in New York City and Hollywood, California; the role of technology companies, particularly hybrid telecommunications/content companies and how they intersect with the creative industries and influence content innovation; the media and its symbiotic relationship with politics.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9303 Advanced Topics—Organizational Behavior and Organizational Theory

3 Credits This course familiarizes students with a broad range of theoretical perspectives in contemporary organization theory and organizational behavior. The course spans levels of analysis. It adopts mostly a practice perspective and focuses on meso-levels of analysis (inter-group collaboration and competition) and micro-levels of interpersonal and social psychological processes within organizations.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9313 Introduction to Behavioral Sciences
This interdisciplinary seminar is limited to doctoral students. The seminar focuses on behavioral sciences, the areas of inquiry relating to the human condition or human behavior. This definition encompasses a wide variety of disciplines, from the social sciences and humanities to a corner of the biological sciences. The fields of study are as diverse as comparative literature, geography, psychiatry and mathematics (to name just a few). The course focuses on sociology, anthropology, history and political science; the emphasis is on sociology. The course explores a number of topics (social order, social solidarity, conflict, social classes, status) that have generated strong interest among social scientists. The course and the final paper pay special attention to the process of developing original theoretical arguments, suitable for empirical exploration.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9321 Special Topics

3 Credits This course requires individualized readings on special topics.

Prerequisite(s): Doctoral standing or instructor’s permission.
Note: Research methods seminars

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9323 Special Topics

3 Credits

MG 9343 Research Project in Organizational Behavior

3 Credits This project integrates and applies advanced research techniques used in studies of organizations. Students develop and carry out individual applied research projects

Prerequisite(s): Advanced standing and MG 6333 or instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9403 Business Research Methods

3 Credits This course introduces theory and techniques of business research methods. The course introduces the philosophy of science and the principles of investigation in the social sciences. Students learn to design a study, sample and choose a research design. Also discussed are basic data preparation, measurement and analysis procedures, focusing on univariate and multivariate statistics.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 9413 Quantitative Methods Seminar I

3 Credits The introductory PhD-level course covers quantitative analysis. Topics include specification, estimation and inference in the context of models that start with the standard linear regression framework. After reviewing the classical linear model, students develop the asymptotic distribution theory necessary for analyzing generalized linear and nonlinear models. Students then analyze estimation methods such as instrumental variables, maximum likelihood, generalized method of moments (GMM) and others. Inference techniques used in the linear regression framework (such as t and F tests) is extended to Wald, Lagrange multiplier, likelihood ratio and other tests. Finally, the linear regression framework is extended to models for panel data, multiple equation models and models for discrete choice.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9423 Quantitative Methods Seminar II

3 Credits In this seminar, students gain an understanding of the theories underpinning economic and quantitative analysis in business. The seminar examines three different but interrelated academic disciplines to achieve this end: the axiomatic foundations of economics, the assumptions and methods that create the basis for game-theoretic analysis and the deviations from the economic rationality required by these methodologies that have been identified by the behavioral decision-making literature.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9433 Qualitative Research Methods

3 Credits The course covers methods that allow students to enter natural social settings to capture data about human behavior in the actual contexts in which people pursue their daily lives. These methods include observation and interviewing. The emphasis is on studying close-up the worlds of other people. The course helps participants learn to make sense of data inductively, i.e., from the bottom up. This course is not about hypothesis testing. Rather, it is about building grounded theory. The focus is on coding and categorizing qualitative data (observational notes and interview transcripts). Students learn to go beyond journalistic description of data and use the analysis that characterizes good inductive social science.

Prerequisite(s): Doctoral standing or instructor’s permission.
Note: Independent Research
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9501 eMOT Capstone-1

1.5 Credits First half of the eMOT Capstone course. Please see MG 9503 eMOT Capstone Project Course for full description. Both MG 9501 and MG 9511 courses may be taken in same semester.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 9503 eMOT Capstone Project Course

3 Credits This course provides an integrative and state-of-the-art intellectual experience for participants at the conclusion of the program. The course is divided into two half semesters. The first half semester enables participants to focus on discerning the overarching trends which are driving innovation in various industry sectors. The class is divided into small groups each of which develops a comprehensive view of a particular industry sector. In the second half of the course, participants focus on the culminating project of the eMOT Program. Participants can choose to do their final projects on firms, issues related to technology management or as an outgrowth of the emphasis on entrepreneurship in the program, a business plan. Participants are encouraged to employ relevant concepts and insights that they have acquired during the course of the program.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9511 eMOT Capstone-2

1.5 Credits Second half of the eMOT Capstone course. Please see MG 9503 eMOT Capstone Project Course for full description. Both MG 9501 and MG9511 courses may be taken in same semester.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9601 eIM Capstone-1

1.5 Credits First half of the eIM Capstone course. Please see MG 9603 eIM Capstone Project Course for full description. Both MG 9601 and MG 9611 courses may be taken in same semester.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9603 eIM Capstone Project Course

3 Credits This course provides an integrative and state-of-the-art intellectual experience for participants at the conclusion of the program. The course is divided into two half semester. The first half semester enables participants to focus on discerning the overarching trends which are driving innovation in various industry sectors. The class is divided into small groups each of which develops a comprehensive view of a particular industry sector. In the second half of the course, participants focus on the culminating project of the eIM program. Participants can choose to do their final projects on firms, issues related to technology management or as an outgrowth of the emphasis on entrepreneurship in the program, a business plan. Participants are encouraged to employ relevant concepts and insights that they have acquired during the course of the program.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9611 eIM Capstone-2

1.5 Credits Second half of the eIM Capstone course. Please see MG 9603 eIM Capstone Project Course for full description. Both MG 9601 and MG 9611 courses may be taken in same semester.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
**MG 9651 The Modern CIO: Challenges and Opportunities**

*1.5 Credits* The Chief Information Officer (CIO) role has evolved from keeper of the infrastructure under the CFO, to an executive managing the organization’s information and sitting at the executive table. The CIO is the key strategic agent for the organizational use of technology and is the key agent in the creative-destructive process mediated by technology. Today technology is the single greatest factor in strategic change in a firm. The CIO is the executive best positioned to manage the creative-destructive power of technology and effect firm sustainability in the face of massive changes in markets. This course helps aspiring CIOs investigate this new and evolving role, using presentations, research and interviews of industry and public sector CIOs and CTOs as well as studying the market demands for CIOs and CTOs.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9683 Internship and Action Learning**

*3 Credits* This course provides graduate students the opportunity to work in an organization relevant to their field of interest in an action-learning context under faculty supervision. It exposes graduate students to relevant, state-of-the-art and best practices in modern management from the perspective of reflective involvement and interaction in the field. Students submit a paper and oral presentation based on work accomplishments as well as a review of written evaluation by the onsite supervisor. This course may be taken only once.

*Prerequisite(s):* Approval of the Program Director

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9691 The Modern Chief Information Security Officer: Challenges and Opportunities**

*1.5 Credits* The role of Chief Cyber Security Officer or Chief Information Security Officer has evolved from securing computer systems under the CIO to an executive managing the organization's information security and sitting at the executive table. The officer is a key strategic agent for the organizational use of cyberspace. The CISO has become the key player in the increasingly dangerous and insecure area of cyberspace, where firms must operate for maximum competitive advantage. The CISO is the executive best positioned to manage the security of the firm’s assets/infrastructure and operations in cyberspace. This course helps aspiring CISOs investigate this new and evolving role, using lectures, research, and interviews of industry and public sector CISOs, as well as by studying the market demand for CISO positions.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9703 Project in Strategy and Innovation**

*3 Credits* This course integrates concepts and theories from several other courses. The course usually considers issues from a holistic and top-management perspective; employs case studies and projects to focus on key interrelationships between strategy, technology, innovation, corporate culture, organization structure and human factors; and covers domestic and global corporations, small, medium and large firms; and established and new enterprises.

*Prerequisite(s):* Advanced standing.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MG 9753 Selected Topics in Management

3 Credits Students analyze and discuss current topics in various fields.

Prerequisite(s): Advanced standing and Department’s Chair’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9763 Readings in Management

3 Credits This directed individual study of supervised readings explores advanced areas of management.

Prerequisite(s): Department Chair’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9771 Readings in Management

1.5 Credits This directed individual study of supervised readings discusses advanced areas of management.

Prerequisite(s): Department Chair’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9781 Selected Topics in Management

1.5 Credits Students analyze and discuss current topics in various fields.

Prerequisite(s): Advanced standing and Department Chair’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9853 Selected Topics in Organizational Behavior

3 Credits This course discusses and analyzes current topics in organizational behavior.

Prerequisite(s): Advanced standing and instructor's permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MG 9861 Readings in Organizational Behavior

1.5 Credits Students undertake directed individual study or supervised readings in advanced areas of organizational behavior.
Prerequisite(s): Academic Director’s permission.
Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9873 Readings in Organizational Behavior**

3 Credits This course emphasizes directed individual study or supervised readings in advanced areas of organizational behavior.

Prerequisite(s): Program Director’s permission.
Note: Course descriptions for other than Organizational Behavior courses can be found in the MS in Management [MSM] section of this catalog.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MG 9913 Independent Research**

3 Credits In this course, students undertake directed individual study or supervised readings in advanced areas of the thematic electives and are advised by the doctoral adviser. Three credits required.

Prerequisite(s): Doctoral standing or instructor’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PL 4052 Business Ethics**

2 Credits

**Manufacturing Engineering**

Graduate Courses

The courses with MN designations below are followed by courses from other programs that commonly are taken by manufacturing engineering students.

**Manufacturing Engineering**

Graduate Courses

The courses with MN designations below are followed by courses from other programs that commonly are taken by manufacturing engineering students.

**MN 6113 Quality Control and Improvement**
3 Credits This course provides students with a solid foundation in the cost of quality, quality assurance and quality management. Emphasis is placed on the basic tools of quality control such as control charts and their use, the concept of “out of control,” acceptance sampling, variables and attributes charts, and producer’s and consumer’s risk. This course uniquely demonstrates the power of teams of people with different expertise to improve quality. A course project is required.

Prerequisite(s): MA 6513 or equivalent.
Also listed under: IE 6113.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 6123 Quality Engineering Using Robust Design

3 Credits This course reviews broadly the procedures involved in improving the quality of manufacturing. By employing both Taguchi techniques, such as the use of signal-to-noise ratio representations and other techniques less sensitive to parameter interactions, a full spectrum of robust design methods are presented. Applications of these procedures are reviewed, including online troubleshooting methods to assure quality in manufacturing.

Prerequisite(s): MN 6113 or IE 6113.
Also listed under: IE 6123.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 6303 Operations Management

3 Credits This course examines analytical techniques to design and operate production and service systems, including facility layouts and locations, capacity planning, job sequencing, inventory control and quality control. Topics include introductory linear programming and other formal methods. Students use computers and case studies.

Also listed under: MG 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 6323 Building High Performance Teams

3 Credits Successful manufacturing programs require the teaming of a number of professionals having a variety of types of expertise, such as product design, manufacturing-process design, production engineering, quality control, testing and packaging. In the past, these individual experts were involved only in a serial fashion in the overall product realization process, with not very effective results. Considerable evidence suggests that uniting these experts in a consistent team produces substantial benefits. This course provides students with the skills and knowledge to build work-unit effectiveness. Topics include diagnosing team functioning, understanding group dynamics, and creating a productive team culture, surfacing and resolving critical issues, and implementing strategies for organizational support.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 6353 Quality Management
3 Credits This course examines how quality and overall customer satisfaction—as a primary objective of manufacturing and service operations—is a proven competitive weapon. Students learn the concepts and methods to build quality into the management process. Total quality management (TQM) and similar approaches are covered through readings, cases and examples.

Also listed under: MG 6353.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 6463 Supply Chain Management

3 Credits This course introduces supply-chain management. Topics cover: Qualitative and quantitative aspects of supply chain management. The course objective is to: (1) introduce students to the standard business concepts (and associated terminology) involved in the retailing and supply-chain management arena; (2) develop student skills in understanding and analyzing retailing, marketing, logistics, operations, channel management and allied issues and the interactions between them; and (3) examine and discuss the important role played by technology and integration at various points in the supply chain.

Also listed under: MG 6463.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 6513 Design Strategies

3 Credits Product design is a major determinant of product cost, quality and customer satisfaction. This course explores the design process, including establishing customer requirements and developing product specifications, conceptual design, detailed design, design for manufacturability, competitive analysis and design for the environment. Computer-aided applications and case studies are reviewed.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 7503 Introduction to Target Costing—Customer Driven Product Design

3 Credits Target Costing is a disciplined process for determining and realizing a total cost at which a product with specified functionality must be produced to generate the desired profitability at its anticipated selling price. This course presents both the theoretical foundation and the practical application of Target Costing methodology to the product-realization process. The topics include basic accounting, principles of Target Costing, the Target Costing Process, quantifying the customer requirements, defining the product feature set, price forecasting, experience curves, cost- functionality tradeoffs and implementation check lists. The course includes a hands-on design project in which teams of students will apply the principles of target costing to design a new product.

Note: Online version available.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 7713 Product Realization Process
Getting new products developed and to market is a major factor in determining global competitiveness. This course uses case studies to illustrate the product-realization process and the successful application of R&D, concurrent engineering, cross-functional teams, continuous improvement, computer applications, target costing and management of new product development.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7763 Manufacturing Resources Planning**

3 Credits This course discusses computerized systems to run a manufacturing business effectively. Also discussed are the process of software specification, evaluation, selection and implementation. Other topics include manufacturing resources planning logic, enterprise resource planning, manufacturing-execution systems, inventory management and bill of materials. Several software systems and their features are highlighted.

*Also listed under: IE 7763.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7853 Computer Integrated Manufacturing Systems (CIMS)**

3 Credits This course introduces the basic concepts of manufacturing products with complex processes that rely heavily on computer and data-processing technologies. All aspects relative to products and processes-planning, design, manufacturing, shipping are addressed from a variety of perspectives. Techniques to manage and optimize manufacturing productivity are explored.

*Also listed under: IE 7853.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7873 Lean Manufacturing**

3 Credits This course provides an overview to the basic principles, and theories of lean manufacturing which involves identifying and eliminating non-value-adding activities in design, production, and supply chain management. Students will learn an integrated approach to efficient manufacturing with emphasis on synchronized product, quick changeover, cell design, visual factory, value stream, one-piece flow and understand the metrics used to monitor performance.

*Also listed under: IE 7873.*

*Note: Online version available.*
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7883 Manufacturing Systems Engineering**

3 Credits This course concentrates on contemporary techniques for product design and manufacture, including financials of the manufacturing firm, quality, reliability, Taguchi methods of product and process design, scale up and partitioning, production flows, modern manufacturing methods such as Just-In-Time/Total-Quality-Control, pull and synchronized manufacturing.
Cultural factors are also discussed.

Also listed under: IE 7883.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7893 Production Science**

3 Credits This course reviews just-in-time and synchronous manufacturing methods. It analyzes the basic dynamics of factories to understand the importance of congestion and bottleneck rates on cycle time and inventories. Analytical models are developed to study variability and randomness introduced by breakdown, setups and batching. Simulation studies are used to provide data on performance of transfer lines.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7923 Design for Manufacturability**

3 Credits This course introduces concepts and techniques for economical, functionally sound and high-quality product design for manufacture. The emphasis is on designing for easy robotic and manual assembly, and on using plastics effectively to reduce manufacturing costs. Managerial and organizational approaches and case studies of successful designs are reviewed.

Also listed under: IE 7923.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7933 Environmental Health and Safety**

3 Credits This course presents an overview of environmental, health and safety management. Students are introduced to management systems within a manufacturing operation. The course explores the motivations and strategies for environmental, health and safety management. Students learn about the mandatory standards along and about the technical and legal rationale for insuring that workers have a safe and healthy workplace. Because workers safety and health are protected by laws, these skills are needed to work effectively in operations; human resources and employee development as well as industrial relations.

Also listed under: IE 7933.
Note: Online version available.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 7943 Physical Design of Products**

This graduate course is offered irregularly in response to industry demand.
MN 7953 Basics of Supply Chain Operations Management

3 Credits Supply chain operations seeks to integrate and accelerate the flow of materials, information and cash, throughout the process of supplying goods or services. Supply chain operations optimizes the efforts of suppliers, manufacturers, warehouses, distributors, retailers and customers to create an efficient and robust process. On the service side the same concepts prevail with the suppliers, institutions, providers, administrators and customers. All businesses are part of a supply chain, and understanding and realizing this relationship leads to economies of time, mate- rial, money and improved customer service.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 7963 Electronics Systems Manufacturing

3 Credits In this course, students understand that the physical design and manufacturability of modern electronics systems results from tradeoffs involving partitioning, electrical performance, cooling and mechanical stresses. Design parameters are derived to study the tradeoffs, along with specific examples from reverse-engineering studies. The current status and future directions of low-cost, high-volume manufacturing technologies are examined.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 7983 Supply Chain Infrastructure

3 Credits Effective supply chain operations require well designed, quality products, and the echelons of the supply chain must operate as a team. These elements, also termed the infrastructure, are presumed to exist. The objective of this course is to provide detailed information on the infrastructure elements required to operate a competitive supply chain. This infrastructure will cover product design and development, quality, employee involvement and communication, supplier and customer relationships, logistics, warehousing, information technology and e-business. Among the topics covered in detail will be product realization process and product design; house of quality; quality improvement process; six sigma; kaizan; employee motivation; communication and team dynamics; logistics including networks, third and fourth party organizations; warehousing, including optimum location, innovative information technology and e-business models.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 7993 Supply Chain Engineering

3 Credits Students in this course gain an understanding of how companies plan, source, make and deliver their products with a global competitive advantage. The course stresses the engineering components in developing an integrated supply chain that covers the entire manufacturing enterprise. It looks at the supply-chain infrastructure and the velocities of different models. The focus is on understanding and detecting the constraints of the infrastructure and the lowest common denominator of the information system used. Students also gain an understanding of logistical networks and the optimizing of the various traffic and location alternatives. Synchronization of supply and demand is examined in detail, looking at variability in both processes with the objective of maximizing throughput and capacity, emphasizing partnering, e-commerce and the bullwhip effect. Finally, the course establishes global performance measurements that compare companies in different industries.

Also listed under: IE 7993.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MN 8023 Thermal Design of Electronics System for Performance and Reliability

This graduate course is offered irregularly in response to industry demand.

MN 8043 Thermal Issues in Manufacturing Processes

This graduate course is offered irregularly in response to industry demand.

MN 8643 New Product Development

3 Credits This course examines the dynamics of technology and the pressures of competition that drive enterprises to make their product-development and production processes strategically more effective and economically more cost and time efficient. The course covers the state of the art in new product activities for services and manufacturing firms. It also examine in-depth the linkages among marketing, technology and manufacturing technology.

Also listed under: MG 8643.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 8653 Managing Technological Change and Innovation

3 Credits This course focuses on how to manage effectively technological change and innovation by using a dual perspective. One perspective is based on individual, group and organizational theory, research and practice. This body of literature, viewpoints and experience provides essential guides to manage successfully the introduction of new technologies. Realizing the full potential of new technologies requires managing change effectively to assure 100 percent stakeholder commitment. The second perspective is based on innovation theory, research and practice. This body of literature, viewpoints and experience provides key insights to manage effectively the process of innovation and the impact of innovation on all parts of an enterprise. Specifically, explicit consideration is given to a firm’s to manage and inspire people so that they can communicate and innovate effectively.

Also listed under: MG 8653.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 9113 Selected Topics in Manufacturing Engineering I

3 Credits Areas not covered in other courses. Specific topics vary according to the instructor, who may be a visiting professor. Topics and prerequisites are announced during the term before the offering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MN 9123 Selected Topics in Manufacturing Engineering II
3 Credits Areas not covered in other courses. Specific topics vary according to the instructor, who may be a visiting professor. Topics and prerequisites are announced during the term before the offering.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MN 9303 Readings in Manufacturing Engineering I**

3 Credits In this course, students read selected papers and current literature in specialized area of study and are guided by a faculty member. The topic must be beyond the scope of regularly offered courses. The topic must be agreed upon by the student and adviser before registration. A written report on the topic is required.

Prerequisite(s): Approval of adviser, instructor and department head.

**MN 9313 Readings in Manufacturing Engineering II**

3 Credits In this course, students read selected papers and current literature in specialized area of study and are guided by a faculty member. The topic must be beyond the scope of regularly offered courses. The topic must be agreed upon by the student and adviser before registration. A written report on the topic is required.

Prerequisite(s): Approval of adviser, instructor and department head.

**MN 9963 MS Report I**

3 Credits This course is an independent project that demonstrates a student’s professional maturity and graduate-level knowledge. Students, guided by an adviser, are expected to demonstrate experimental work, software development and extensive analyses. A student’s report must include results in one or more of these areas: critical analysis and interpretation of pertinent literature. A required written report (unbound) should represent a worthy contribution.

Prerequisite(s): Adviser’s approval.

**MN 9973 MS Report II**

3 Credits With approval by the graduate adviser, some students may take a 6-credit MS report. This report should be planned during registration for MN 9963. In such cases, MN 9973 is used for the second half of the registration. A grade of S or U is awarded in MN 9963 in these cases, and the letter grade given in MN 9973 applies to all 6 credits.

Prerequisite(s): Adviser’s approval.

**Materials Science**
Materials Science

MT 2811 Materials Science Laboratory

1 Credits Students learn to characterize the microstructure and crystal structure of a material by optical and scanning electron microscopy and X-ray diffraction. The mechanical characterization is accomplished by hardness, tensile and yield strength, impact and fatigue testing.

Prerequisite(s): PH 1013 and CM 1004. Corequisite(s): MT 2813.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

MT 2813 Introduction to Materials Science

3 Credits Students in this course become familiar with atomic structure and bonding, atomic arrangement in crystals, crystal imperfections, mechanical behavior and failure of materials and binary phase diagrams.

Prerequisite(s): PH 1013 and CM 1004. Corequisite(s): MT 2811.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MT 4853 Manufacturing Engineering and Processes

3 Credits This course introduces the manufacturing processes for fabricating components used in mechanical systems; casting processes; bulk metal deformation and sheet-metal forming processes; materials-removal processes; Joining and fastening processes; manufacturing automation; and integrated manufacturing systems.

Prerequisite(s): MT 2811 and MT 2813.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Mathematics

Mathematics

MA 1 Pre-college Math
NC Credits This course reviews trigonometry, quadratic and absolute value questions and inequalities, limits and differentiation of both algebraic and trigonometric functions.

| Weekly Lab Hours: 3 | Weekly Recitation Hours: 0 |

MA 902 Introduction to Precalculus

2 Credits This course covers foundations of Algebra: exponents, multiplication of algebraic expressions, factoring algebraic expressions, working with algebraic fractions, proportionality, rates of change, equation of a line, completing squares, the quadratic formula, solving equations, system of linear equations, inequalities, domain and range of functions.

Prerequisite(s): Placement exam.
Note: Credit for this course may not be used to satisfy the minimum credit requirement for graduation.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 912 Precalculus A

2 Credits This course covers exponential and logarithmic functions, transformations of functions; trigonometric functions.

Prerequisite(s): MA 902.
Note: Credit for this course may not be used to satisfy the minimum credit requirement for graduation.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 914 Precalculus

4 Credits This course covers foundations of algebra: exponents, multiplication of algebraic expressions, factoring algebraic expressions, working with algebraic fractions, proportionality, rates of change, equation of a line, completing squares, the quadratic formula, solving equations, systems of linear equations, inequalities, domain and range of functions, exponential and logarithmic functions, compositions, transformations of functions, right triangles, trigonometry of triangles.

Prerequisite(s): Placement exam. Corequisite(s): EG 1 Examination Hour
Note: Credit for this course may not be used to satisfy the minimum credit requirement for graduation.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 922 Precalculus B

2 Credits Continuation of Precalculus: trigonometric functions, compositions, inverses and combinations of functions, polynomial and rational functions.

Prerequisite(s): MA 912.
Note: Credit for this course may not be used to satisfy the minimum credit requirement for graduation.
MA 954 Calculus for Business and Life Sciences IA

4 Credits This course covers the fundamentals of algebra with a focus on Management and the Life Sciences. The topics include: foundations of algebra, solving equations, exponents, working with algebraic expressions, working with algebraic fractions, proportionality, rates of change, lines in the plane, completing squares, the quadratic formula, systems of linear equations, inequalities, graphs, exponentials, logarithms, inverses, compositions, transformations of functions and right angle trigonometry.

Prerequisite(s): Placement exam. Corequisite(s): EG 1 Examination Hour
Note: Course required only for specific Majors in place of MA 914. Credit for this course may not be used to satisfy the minimum credit requirement for graduation.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1002 The Art of Mathematics

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1024 Calculus I

4 Credits This course covers: Library of functions, functions of one variable. Limits, derivatives of functions defined by graphs, tables and formulas, differentiation rules for power, polynomial, exponential and logarithmic functions, derivatives of trigonometric functions, the product and quotient rule, the chain rule, applications of the chain rule, maxima and minima, optimization. MA 1324 is for students who wish to take MA 1024 but need more review of precalculus. MA 1324 covers the same material as MA 1024 but with more contact hours a week, incorporating a full discussion of the required precalculus topics.

Prerequisite(s): Placement exam or MA 912 or MA 914. Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1054 Calculus I with Precalculus

4 Credits This course covers limits, definition of the derivative, differentiation rules for polynomial and trigonometric functions, applications of the chain rule and introduction to optimization. This Calculus I course provides an indepth review of precalculus.

Prerequisite(s): Placement exam, MA 954, or MA 912 or equivalent. Corequisite(s): EG 1 Examination Hour
Note: course required only for specific majors in place of MA 1024/1324.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 1124 Calculus II

4 Credits This course covers definite integrals, theorems about integrals, anti-derivatives, second fundamental theorem of calculus, techniques of integration, introduction to ordinary differential equations, improper integrals, numerical methods of integration, applications of integration, sequences, series, power series, approximations of functions via Taylor polynomials, Taylor series. MA 1424 is for students who wish to take MA 1124 but need more review of precalculus. MA 1424 covers the same material as MA 1124 but with more contact hours a week, incorporating a full discussion of the required precalculus topics.

Prerequisite(s): MA 1024 or MA 1324. Corequisite(s): EG 1 Examination Hour
Note: credit for this course may be used to satisfy the minimum credit requirement for graduation.

Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1132 Numerical Methods for Calculus

Prerequisite(s): AP credit or transfer credit for Calculus I and II. Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1154 Calculus II with Precalculus

4 Credits This course covers the first and second derivative, optimization problems, antiderivatives, fundamental theorem of calculus, techniques of integration, logarithmic and exponential functions, numerical methods of integration, applications of integration, introduction to differential equations, introduction to series. This Calculus II course provides an in-depth review of precalculus.

Prerequisite(s): MA 1054. Corequisite(s): EG 1 Examination Hour
Note: course required only for specific majors in place of MA 1124/1424.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1252 Calculus for Business and Life Sciences IIA

2 Credits This course covers antidifferentiation, the definite integral, integration by substitution, the Fundamental Theorem of Calculus, area enclosed between curves, average value, integration by parts, introduction to differential equations, improper integrals, numerical integration.

Prerequisite(s): MA 1054. Corequisite(s): EG 1 Examination Hour
Note: Course required only for specific majors.

Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 1324 Integrated Calculus I

4 Credits This course covers: Library of functions, functions of one variable. Limits, derivatives of functions defined by graphs, tables and formulas, differentiation rules for power, polynomial, exponential and logarithmic functions, derivatives of trigonometric functions, the product and quotient rule, the chain rule, applications of the chain rule, maxima and minima, optimization. MA 1324 is for students who wish to take MA 1024 but need more review of precalculus. MA 1324 covers the same material as MA 1024 but with more contact hours a week, incorporating a full discussion of the required precalculus topics.

Prerequisite(s): Placement exam or MA 912 or MA 914.
Corequisite(s): EG 1 Examination Hour
Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 1424 Integrated Calculus II

4 Credits This course covers definite integrals, theorems about integrals, anti-derivatives, second fundamental theorem of calculus, techniques of integration, introduction to ordinary differential equations, improper integrals, numerical methods of integration, applications of integration, sequences, series, power series, approximations of functions via Taylor polynomials, Taylor series. MA 1424 is for students who wish to take MA 1124 but need more review of precalculus. MA 1424 covers the same material as MA 1124 but with more contact hours a week, incorporating a full discussion of the required precalculus topics.

Prerequisite(s): MA 1024 or MA 1324.
Corequisite(s): EG 1 Examination Hour
Note: credit for this course may be used to satisfy the minimum credit requirement for graduation.
Weekly Lecture Hours: 6 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2012 Elements of Linear Algebra I

2 Credits This course introduces vector concepts. Linear transformations. Matrices and Determinants. Characteristic roots and eigenfunctions.

Prerequisite(s): MA 1124 or equivalent.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2054 Applied Business Data Analysis I

4 Credits This course covers applications of theories of random phenomena to problems in business management. Topics include probability theory, discrete and continuous probability distributions, sampling, measures of central value and dispersion, sampling distributions, statistical estimation and introduction to hypothesis testing. Use of statistical software is integrated with the previous topics; examples are drawn from problems in business decision-making. Applications to advanced statistical applications in business management. Emphasis is on application of concepts. Use of statistical software integrated with the previous topics.

Prerequisite(s): MA 1054 or equivalent.
Note: Course required only for Management Majors. Credit for this course may not be used to satisfy the requirements for other majors.
MA 2112 Multivariable Calculus A

2 Credits This course introduces Multivariable Calculus. Analysis of functions of several variables, vector valued functions, partial derivatives, optimization techniques.

Prerequisite(s): MA 2012.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2122 Multivariable Calculus B

2 Credits This course continues Multivariable Calculus. Multiple integrals, parametric equations, vector fields, line integrals, surface integrals and major theorems concerning their applications.

Prerequisite(s): MA 2112.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2132 Ordinary Differential Equations

Prerequisite(s): MA 2012.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2212 Data Analysis I

Prerequisite(s): MA 1124 or equivalent.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2222 Data Analysis II

2 Credits This course covers point and interval estimation. Hypothesis testing. Linear regression. One-way analysis of variance. Use of statistical software is integrated with the previous topics.
Prerequisite(s): MA 2212.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2312 Discrete Mathematics I

2 Credits This course covers logic and induction. Sets and functions. Recursive definitions. Counting techniques. Inclusion-exclusion principle.

Prerequisite(s): MA 1124 or equivalent.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 2322 Discrete Mathematics II

2 Credits This course covers recurrence relations and generating functions. Equivalence relations and partial orderings. Graphs and connectivity of graphs. Trees and sorting. Boolean algebra, languages and finite state machines.

Prerequisite(s): MA 2312.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3012 Introduction to Probability I

Prerequisite(s): MA 2112 or equivalent.
Note: Not open to students who have taken MA 2212.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3022 Probability Theory II

2 Credits This course covers multivariate random variables, moment generating functions, properties of expectation, limit theorems and gives an introduction to random processes and their applications.

Prerequisite(s): MA 2212 or MA 3012.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3103 Problem Solving and Proofs

3 Credits This course covers mathematical problem solving, proofs and innovative reasoning. Discussion of independent challenging problems from Analysis, Complex Analysis, Probability, Combinatorics, Linear Algebra, Number Theory and Graph
Theory.

Prerequisite(s): MA 2312 and MA 2012.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3112 Complex Variables I

Prerequisite(s): MA 2122 or equivalent.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3203 Linear Optimization

3 Credits This course examines linear optimization problems with constraints; optimality conditions and duality theory, the simplex method, complexity of the simplex method, interior point methods, selected applications, network flow problems and the network simplex method.

Prerequisite(s): MA 2312 and MA 2112.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3303 Differential Geometry

3 Credits This course covers curves and surfaces. Curvature. First and second fundamental form. Gaussian curvature. Geodesics, Minimal Surfaces. Gauss-Bonnet Theorem.

Prerequisite(s): MA 2122.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 3914 Project in Mathematics I

4 Credits In this course, students read, study and investigate selected topics in mathematics. Problems are discussed and presented by participating students.

Prerequisite(s): approval of departmental adviser.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 4013 Introduction to Number Theory

3 Credits This course covers properties of integers and prime numbers. Congruences. Theorems of Fermat, Euler and Wilson. Quadratic residues. Diophantine equations.
Prerequisite(s): MA 1124 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4023 Elements of Abstract Algebra**

*3 Credits* This course covers basic properties of groups, rings, fields, Euclidean rings and modules. Field extensions and Galois theory. Finite fields.

Prerequisite(s): MA 2012.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4113 Introduction to Mathematical Statistics**

*3 Credits* This is a standard first course in mathematical statistics, recommended for those who will take advanced courses in statistics. Topics covered: Sampling distributions, tests of hypotheses, significance tests, point and interval estimation, regression and analysis of variance.

Prerequisite(s): MA 3012 or MA 2222.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4123 Statistical Methods**

*3 Credits* This course covers analysis of variance with simple experimental designs. Topics covered: Sampling procedures, including sequential analysis. Nonparametric statistical methods. Statistical decisions.

Prerequisite(s): MA 4113.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4133 Time Series**

*3 Credits* This course examines properties of time series, regression methods, linear processes, moving average processes, autoregressive processes, ARIMA models, autocorrelation, nonstationarity, parameter estimation, forecasting, regression models, ARCH, GARCH models, applications.

Prerequisite(s): MA 2222.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4413 Applied Partial Differential Equations**

*3 Credits* This course looks at the heat equation, homogeneous and non-homogeneous boundary conditions, Green’s function, separation of variables, Fourier series and Fourier transform, Maximum principle, existence and uniqueness, Poisson integral
formula, the wave equation. Shock waves, conservation laws.

Prerequisite(s): MA 2132 and MA 3112.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4423 Introductory Numerical Analysis**

Prerequisite(s): MA 2132 and some experience in computer programming.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4433 Complex Variables**

Prerequisite(s): MA 2132 and MA 3112.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4613 Analysis I**

3 Credits This course covers the study of basic topics in analysis with emphasis on methods. Sequences, series, functions, uniform convergence, continuity, partial differentiation, extreme value problems with constraints, Riemann integrals, line integrals, improper integrals, integrals with parameters, transformations, Riemann-Stieltjes integral, uniform and absolute convergence of integrals. Beta and Gamma functions.

Prerequisite(s): MA 2122 and MA 2132.
Note: This course is required for MA minors.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 4623 Analysis II**

3 Credits This course covers the study of basic topics in analysis with emphasis on methods. Sequences, series, functions, uniform convergence, continuity, partial differentiation, extreme value problems with constraints, Riemann integrals, line integrals, improper integrals, integrals with parameters, transformations, Riemann-Stieltjes integral, uniform and absolute convergence of integrals. Beta and Gamma functions.

Prerequisite(s): MA 4613.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 4924 Project in Mathematics II

4 Credits In this course, students read, study and investigate selected topics in mathematics. Students discuss and present problems.

Prerequisite(s): Departmental adviser’s approval.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 4993 Thesis for Bachelor of Science Degree

3 Credits The course provides the framework for a Bachelor’s thesis. In the Bachelor’s thesis, a student reports on an independent investigation of a topic in Mathematics that demonstrates an in-depth knowledge of that area of Mathematics and proficiency in using its specific methods.

Prerequisite(s): Departmental adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 5313 Applied Mathematics in Engineering and Science I

Prerequisite(s): MA 2122 and MA 2132 or equivalent.
Note: Not acceptable for graduate credit in the Department of Mathematics.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 5323 Applied Mathematics in Engineering and Science II

Prerequisite(s): MA 5313.
Note: Not acceptable for graduate credit in the Department of Mathematics.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 5413 Stringology: Mathematics of String Comparisons in Computational Biology
3 Credits The course addresses basic combinatorial problems of string manipulation, string matching, string editing, string distance computations, arising from areas of text processing, computational biology and genomics. Classical, modern and entirely new approaches to these problems are presented with all necessary mathematical and computer science backgrounds (including coding theory and symbolic manipulation). Emphasis is on practical and effective algorithm implementations.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6003 Elements of Discrete Mathematics**

3 Credits This course covers logic, sets and functions, algorithms, analysis of algorithms. Mathematical models, primitives of naïve set theory. Covered topics: Mathematical reasoning, methods of proof, mathematical induction, recursive definitions, recursive algorithms, Counting, the Pigeonhole principle, discrete probability, recurrence relations, generating functions, inclusion-exclusion. Introduction to graph theory, counting and algorithm analysis, relations, graphs, Boolean algebras, circuits. Turing Machines, algorithm complexity. Introduction to algebraic structures.

Prerequisite(s): Adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6013 Applied Matrix Theory I**

3 Credits This course covers the basics of linear algebra and matrix theory. Topics included: Vector Spaces, linear combinations, affine combinations, linear dependence, affine dependence, bases, dimension, isomorphism, subspaces, calculus of subspaces, dimension of subspaces, dual vector spaces and dual bases, direct sums of vector spaces, quotient spaces, bilinear forms, tensor products, permutations, cycles, parity, linear transformations, transformations as vectors, polynomials, inverses, matrices, matrices associated with linear transformations, invariance, reducibility, projections, adjoints, change of basis, similarity.

Prerequisite(s): MA 2012 and MA 2122 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6023 Applied Matrix Theory II**

3 Credits linear algebra and matrix theory. Topics covered: Linear mappings, their range and null spaces, tensor product of transformations, determinants, eigenvalues, multiplicities, triangular form, nilpotence, Jordan form, inner products, inner product spaces, orthogonality, completeness Schwarz’s inequality, complete orthonormal sets, the projection theorem, linear functionals, selfadjoint transformations, polarization, positive transformations, isometries, change of orthonormal basis, characterization of spectra, the spectral theorem, normal transformations orthogonal transformations, functions of transformations, polar decomposition, commutativity. Applications for matrices and for differential equations.

Prerequisite(s): MA 6013.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6103 Graph Theory**

Prerequisite(s): MA 6003 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6123 Queueing Theory

3 Credits This course covers: Steady-state solutions for single and multiple channels. Various arrival and service distributions and queuing disciplines. Transient solutions. Emphasis on theory, with solution techniques given for specific classes of queues.

Prerequisite(s): MA 6003 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6133 Elements of Number Theory

3 Credits This course covers: Prime numbers, the fundamental theorem of arithmetic, linear Diophantine equations. Fermat’s Little Theorem, Wilson’s Theorem, Euler’s theorem. Linear congruences, Chinese Remainder Theorem, Euler phi function, Moebius inversion. Primitive roots and indices, quadratic congruences, Quadratic reciprocity law. Perfect numbers, sums of squares, Siegel’s theorem. The prime number theorem. Computational number theory, primality testing, Cryptography. Elliptic curves.

Prerequisite(s): MA 6003 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6143 Optimization: Linear and Nonlinear Programming

Prerequisite(s): MA 6003 or adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6213 Elements of Real Analysis I

3 Credits This course and its sequel MA 6223 rigorously treat the basic concepts and results in real analysis. Course topics include limits of sequences, topological concepts of sets for real numbers, properties of continuous functions and differentiable functions. Important concepts and theorems include supremum and infimum, Bolzano-Weierstrass theorem, Cauchy sequences, open sets, closed sets, compact sets, topological characterization of continuity, intermediate value theorem, uniform continuity, mean value theorems and inverse function theorem.
**MA 6223 Elements of Real Analysis II**

*3 Credits* This course continues MA 6213. The topics are integration, series of real numbers, sequences and series of functions and Fourier series. Important concepts and theorems include Riemann and Riemann-Stieltjes integral, fundamental theorem of calculus, the mean value theorem of integrals, Dirichlet test, absolute and conditional convergence, uniform convergence, Weierstrass test, power series, orthogonal functions and Fourier series.

**Prerequisite(s):** MA 6213.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6233 Theory of Ordinary Differential Equations I**

**Prerequisite(s):** MA 6213 and MA 6223.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6243 Theory of Ordinary Differential Equations II**

**Prerequisite(s):** MA 6233.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6253 Theory of Partial Differential Equations I**

**Prerequisite(s):** MA 6213 and MA 6223.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**MA 6263 Theory of Partial Differential Equations II**
MA 6283 Mathematical Modeling in Biology

Prerequisite(s): MA 2122 and MA 2132.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6303 Elements of Complex Analysis

3 Credits This course covers: Complex numbers, analytic functions, Cauchy’s theorem and consequences, isolated singularities, analytic continuation, open mapping theorem, infinite series and products, harmonic and subharmonic functions, maximum principle, fractional linear transformations, geometric and local properties of analytic functions, Weierstrass Theorem, normal families, residues, conformal mapping, Riemann mapping theorem, branch points, second order linear O.D.E.’s.

Prerequisite(s): MA 2122 and MA 2132 or equivalent.
Note: Not open to students who have taken MA 3112 or MA 4433.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6313 Applications of Complex Analysis

3 Credits This course continues MA 6303. Topics covered: Residues, complex integration, Laplace transforms, Harmonic functions and classical examples from thermodynamics, electricity and magnetism, fluid flow, The Schwarz-Christoffel transformation.

Prerequisite(s): MA 6303.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6403 Elements of Geometry and Topology

3 Credits This course covers: Differential geometry in the plane. Introduction to transformation groups. Space curves and ruled surfaces. Tensors and exterior forms. Manifolds and tensor fields. Theory of surfaces. Introduction to Riemannian geometry.
Prerequisite(s): MA 2122 and MA 2132 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6513 Applied Statistics I (Data Analysis)

3 Credits This course covers: Treatment of statistical methods and application to analysis of data, fitting of functions to data. Estimation of population parameters, t-tests, chi square tests, rank tests.

Prerequisite(s): MA 1124 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6523 Regression-Analysis of Variance-Time Series Analysis

3 Credits This course discusses models and computational schemes associated with correlation, regression coefficients, analysis of variance and time series models.

Prerequisite(s): MA 4113 or MA 6513.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6583 Calculus of Variations

Prerequisite(s): MA 4623 or MA 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6653 Numerical Analysis

Prerequisite(s): MA 2122, MA 2132 and some experience in computer programming.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6663 Numerical Solution of Partial Differential Equations

*Prerequisite(s): MA 6013, MA 6653 and some experience in computer programming.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### MA 6683 Partial Differential Equations of Mathematical Physics

*Prerequisite(s): MA 4623 or equivalent.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### MA 6813 Elements of Probability

3 Credits This course covers: Probability of events, distribution of random variables, joint distribution, transformations.

*Prerequisite(s): MA 2122 and MA 3012 or equivalent.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### MA 6823 Stochastic Processes

3 Credits This course covers: Normal and stationary processes, Wiener processes, Poisson and renewal processes, Markov processes.

*Prerequisite(s): MA 6813 or equivalent.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### MA 6833 Statistical Inference I

*Prerequisite(s): MA 6813 or equivalent.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

### MA 6843 Statistical Inference II

Prerequisite(s): MA 6833.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6853 Multivariate Analysis

Prerequisite(s): MA 6843.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6863 Regression and Analysis of Variance

Prerequisite(s): MA 6843.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6873 Nonparametric Methods in Statistics

3 Credits This course covers: Statistical methods not bound by assumption of known parametric form of the distribution of observations. Applications to engineering and scientific research in which observations are not ordered on a numerical scale. Order statistics, tolerance regions, permutation tests, goodness of fit tests, limiting distributions and largesample properties of tests.

Prerequisite(s): MA 6813.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6913 Time Series Analysis I

3 Credits In this course, students carefully study tractable models for statistical analysis of scalar time series. Models treated: (1) “error plus trend” models, (2) stationary stochastic process models with special emphasis on autoregressive models. Estimation, tests of hypotheses and multiple-decision procedures for these models. Spectral representation and filtering, estimation of spectral density.
Prerequisite(s): MA 6813 and MA 6843.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 6923 Time Series Analysis II

3 Credits  In this course, students carefully study tractable models for statistical analysis of scalar time series. Models treated: (1) “error plus trend” models, (2) stationary stochastic process models with special emphasis on autoregressive models. Estimation, tests of hypotheses and multiple-decision procedures for these models. Spectral representation and filtering, estimation of spectral density.

Prerequisite(s): MA 6913.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7013 Abstract Algebra

3 Credits  This course covers: Basic algebraic structures, groups, rings, fields, integral domains and modules. Field extensions and Galois theory.

Prerequisite(s): MA 6013 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7033 Linear Algebra I

3 Credits  This course covers: Basic ideas of linear algebra: Fields, vector spaces, basis, dependence, independence, dimension. Relation to solving systems of linear equations and matrices. Homomorphisms, duality, inner products, adjoints and similarity.

Prerequisite(s): MA 2012 and MA 2122 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7043 Linear Algebra II

3 Credits  This course continues MA 7033. Topics covered: Basic concepts of linear algebra continuing with: Range, nullity, determinants and eigenvalues of matrices and linear homomorphisms, the polar decomposition and spectral properties of linear maps, orthogonality, adjointness and its applications.

Prerequisite(s): MA 7033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7213 Real and Complex Analysis I

3 Credits  This course provides rigorously and comprehensively treats real analysis. Topics covered: Outer measure, Lebesgue measure, Lebesgue integral, convergence theorems, functions of bounded variation, integration in measure spaces, the Radon-
Nikodym Theorem and Fubini’s theorem.

Prerequisite(s): MA 6213 and MA 6223 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7223 Real and Complex Analysis II

3 Credits This course continues MA 7213 and provides a rigorous and comprehensive treatment of complex analysis. Topics covered: Analytic and meromorphic functions, differentiation and integration, Cauchy’s theorem, Morera’s theorem, Power and Laurent series, residue theory, Rouche’s theorem, conformal mappings, the Riemann mapping theorem and Riemann surfaces.

Prerequisite(s): MA 7213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7313 Functional Analysis I

3 Credits This course, together with its sequel MA 7323, introduces the language and methods of functional analysis. It covers normed spaces, Hilbert spaces, bounded linear functionals, Hahn-Banach theorem, the dual space, bounded operators, Fredholm theory of compact operators, self-adjoint operators and applications to classical analysis.

Prerequisite(s): MA 6013 and MA 7213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7323 Functional Analysis II

3 Credits This course, together with its sequel MA 7323, introduces the language and methods of functional analysis. It covers normed spaces, Hilbert spaces, bounded linear functionals, Hahn-Banach theorem, the dual space, bounded operators, Fredholm theory of compact operators, self-adjoint operators and applications to classical analysis.

Prerequisite(s): MA 7313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7333 Measure Theory I

3 Credits This course presents a unified treatment of that part of measure theory that is most useful for its application in modern analysis. Topics covered: Sets and classes, measures and outer measures, measurable functions, integration, general set functions, product spaces, transformations, probability. The dominated convergence theorem, Riesz Representation Theorem, Vitali-Carathéodory theorem, etc. are covered in conjunction with many examples.

Prerequisite(s): Graduate status.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 7343 Measure Theory II

3 Credits This course continues MA 7333 and presents a unified treatment of that part of measure theory that is most useful for applications in modern analysis. Topics covered: Fubini’s theorem, convolutions and distributions are applied to explicit examples. In this part, Baire’s theorem, the Banach-Stone theorem, the Open Mapping theorem, the Hahn-Banach Theorem are derived with the properties of the Radon-Nikodym derivatives to naturally generalize calculus both differential and integral.

Prerequisite(s): MA 7333.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7353 Fourier and Laplace Transforms

3 Credits This course presents in a unified manner the fundamentals of both continuous and discrete versions of the Fourier and Laplace transforms. Topics covered: Application of transform methods to partial differential equations of mathematical physics. Includes introduction to the Wiener-Hopf technique.

Prerequisite(s): Graduate status or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7403 Topology

3 Credits This course covers: Topological spaces. Compactness, connectedness, continua, extension theorems and metrization theorems. Simplexes, simplicial topology and applications. Fixed point theorems. Graphs and networks. Homology and cohomology theory. Introduction to Morse theory.

Prerequisite(s): MA 6213 and MA 6223 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7503 Manifolds and Lie Groups

3 Credits This course covers: Elementary theory of manifolds. Tangent space, mappings, submanifolds, fields, fiber bundles, Lie groups, homogeneous spaces. Elements of the theory of connections, Riemannian geometry. Imbedded manifolds. Calculus of variations. Harmonic forms, complex manifolds and Morse theory.

Prerequisite(s): MA 6213 and MA 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7543 Topological Methods in Analysis

3 Credits This course covers: Aspects of topological methods and applications to existence theorems in analysis. Use of fixed-point theorems and topological degree to study properties of solutions to ordinary and partial differential equations. No previous courses in topology are required.
Prerequisite(s): MA 4623 or MA 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7603 Topics in Algebra I

3 Credits Course content varies. In spring of the year before the course offering, a detailed description is posted and mailed to all graduate mathematics students.

Prerequisite(s): MA 7013.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7613 Topics in Algebra II

3 Credits Course content varies. In spring of the year before the course offering, a detailed description is posted and mailed to all graduate mathematics students.

Prerequisite(s): MA 7603.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7623 Topics in Linear Algebra I

3 Credits Course content varies.

Prerequisite(s): MA 7033 and MA 7043.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7633 Topics in Linear Algebra II

3 Credits Course content varies.

Prerequisite(s): MA 7623.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7643 Topics in Real Analysis I

3 Credits Course content varies.

Prerequisite(s): MA 6213 and MA 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 7653 Topics in Real Analysis II

3 Credits Course content varies.

Prerequisite(s): MA 7643.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7663 Topics in Complex Analysis I

3 Credits Course content varies.

Prerequisite(s): MA 6303 and MA 6313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7673 Topics in Complex Analysis II

3 Credits Course content varies.

Prerequisite(s): MA 7663.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7683 Topics in Geometry I

3 Credits Course content varies.

Prerequisite(s): MA 6403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7693 Topics in Geometry II

3 Credits Course content varies.

Prerequisite(s): MA 7683.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7703 Topics in Topology I

3 Credits Course content varies.

Prerequisite(s): MA 6403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 7713 Topics in Topology II

3 Credits Course content varies.

Prerequisite(s): MA 7703.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7723 Topics in Applied Mathematics I

3 Credits Course content varies.

Prerequisite(s): Graduate status or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7733 Topics in Applied Mathematics II

3 Credits Course content varies.

Prerequisite(s): MA 7723.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7743 Topics in Probability I

3 Credits Course content varies.

Prerequisite(s): MA 6813.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7753 Topics in Probability II

3 Credits Course content varies.

Prerequisite(s): MA 7743.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7763 Topics in Statistics I

3 Credits Course content varies.
MA 7773 Topics in Statistics II

3 Credits Course content varies.

Prerequisite(s): MA 7763.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7813 Probability

3 Credits This course covers: Measure-theoretic foundations of probability. Expectations, distribution functions, characteristic functions. Modes of convergence of random variables and distribution functions. Laws of large numbers. The multidimensional central-limit theorems and related asymptotic expansions. Infinitely divisible distributions.

Prerequisite(s): MA 7213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7833 Stochastic Processes I

Prerequisite(s): MA 7813.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 7843 Stochastic Processes II

Prerequisite(s): MA 7833.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8003 Advanced Topics in Discrete Mathematics I

3 Credits Course content varies. In spring of year before course offering, a detailed description is posted and mailed to all graduate mathematics students.
MA 8013 Advanced Topics in Discrete Mathematics II

3 Credits Course content varies. In spring of year before course offering, a detailed description is posted and mailed to all graduate mathematics students.

Prerequisite(s): MA 8003.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8023 Advanced Topics in Algebra I

3 Credits Course content varies.

Prerequisite(s): MA 7033 and MA 7043.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8033 Advanced Topics in Algebra II

3 Credits Course content varies.

Prerequisite(s): MA 8023.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8043 Advanced Topics in Real Analysis I

3 Credits Course content varies.

Prerequisite(s): MA 6213 and MA 6223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8053 Advanced Topics in Real Analysis II

3 Credits Course content varies.

Prerequisite(s): MA 8043.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8063 Advanced Topics in Linear Algebra I
MA 8073 Advanced Topics in Linear Algebra II

3 Credits Course content varies.

Prerequisite(s): MA 6303 and MA 6313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8103 Advanced Topics in Complex Analysis I

3 Credits Course content varies.

Prerequisite(s): MA 7213 and MA 7223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8113 Advanced Topics in Complex Analysis II

3 Credits Course content varies.

Prerequisite(s): MA 7213 and MA 7223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8123 Advanced Topics in Geometry I

3 Credits Course content varies.

Prerequisite(s): MA 6403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8133 Advanced Topics in Geometry II

3 Credits Course content varies.

Prerequisite(s): MA 6403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 8143 Advanced Topics in Topology I

3 Credits Course content varies.

Prerequisite(s): MA 7403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8153 Advanced Topics in Topology II

3 Credits Course content varies.

Prerequisite(s): MA 7403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8163 Advanced Topics in Applied Mathematics I

3 Credits Course content varies.

Prerequisite(s): MA 6003.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8173 Advanced Topics in Applied Mathematics II

3 Credits Course content varies.

Prerequisite(s): MA 6003.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8183 Advanced Topics in Probability I

3 Credits Course content varies.

Prerequisite(s): MA 6813.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8193 Advanced Topics in Probability II

3 Credits Course content varies.

Prerequisite(s): MA 6813.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
MA 8203 Advanced Topics in Statistics I

3 Credits Course content varies.

Prerequisite(s): MA 6833 and MA 6843.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8213 Advanced Topics in Statistics II

3 Credits Course content varies.

Prerequisite(s): MA 6833 and MA 6843.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8383 Advanced Topics in Differential Equations

3 Credits Course content varies.

Prerequisite(s): MA 6233 and MA 6243.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 8583 Advanced Topics in Differential Geometry

3 Credits Course content varies.

Prerequisite(s): MA 6403.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9413 Reading in Mathematics I

3 Credits In this course, reading is guided by faculty members and devoted mainly to scholarly papers.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9423 Reading in Mathematics II

3 Credits In this course, reading is guided by faculty members and devoted mainly to scholarly papers.
MA 9433 Reading in Mathematics III

3 Credits In this course, reading is guided by faculty members and devoted mainly to scholarly papers.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9443 Reading in Mathematics IV

3 Credits In this course, reading is guided by faculty members and devoted mainly to scholarly papers.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9453 Reading in Mathematics V

3 Credits In this course, reading is guided by faculty members and devoted mainly to scholarly papers.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9463 Reading in Mathematics VI

3 Credits In this course, reading is guided by faculty members and devoted mainly to scholarly papers.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9583 Selected Topics in Advanced Mathematics I

3 Credits This course reviews current mathematics research. Specific topics vary, depending on instructor.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

MA 9593 Selected Topics in Advanced Mathematics II
3 Credits This course reviews current mathematics research. Specific topics vary, depending on instructor.

Prerequisite(s): Department’s permission.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Mechanical Engineering

ME 498X Special Topics in Mechanical Engineering

*variable credit Credits* The course covers topics of special interest in mechanical engineering to promote exposure to traditional and emerging issues in mechanical engineering not covered in the program’s mainstay courses.

Prerequisite(s): Adviser’s approval.

ME 997X MS Thesis in Mechanical Engineering

*variable credit Credits* The master’s thesis presents results of original investigation in the student’s specialty. This effort can be an extension of ME 9963, with approval of the project adviser. Continuous registration is required. Maximum of 9 credits of ME 9963/ME 997x are counted toward the degree.

Prerequisite(s): Degree status.

ME 999X PhD Dissertation in Mechanical Engineering

3 Credits The doctoral dissertation demonstrates independent study and original contributions in the specialization. Oral examination on subject of dissertation and related topics is required. Also required is a minimum of 24 credits and continuous registration at minimum of 3 credits per semester until the dissertation is completed.

Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam, graduate standing, and dissertation advisor approval

ME 1012 Introduction to Mechanical Engineering

2 Credits This course introduces students to the range of mechanical engineering and emphasizes the basic principles and devices for storing and using energy, directing motion and satisfying needs. Case studies look at design issues and related ethical and professional practice issues. Emphasis is on a mindset of exploration. Engineering standards and standard parts. Teams work on
and present two design challenges.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 2112 Computer Aided Design**

2 Credits The course covers sketching, drawing and computer-aided drafting. Topics: Projection theory—multiview, axonometric, oblique. Auxiliaries, sections, isometrics, dimensions, fasteners, detail and assembly drawings. Introduction to blueprint reading. Overview of CIM and CAD integration with other CIM concepts. A design project incorporates developed skills in visualization, drawing techniques, standards and CAD.

Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 3

**ME 2211 Statics Laboratory**

1 Credits The course deals with measurement and calculations of bending stress, bending moment, shear forces and deflections in beams, buckling of struts and equilibrium analysis of structures.

Corequisite(s): ME 2213.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

**ME 2213 Statics**

3 Credits The course covers three-dimensional vector treatment of the static equilibrium of particles and rigid bodies. Topics: Equivalent force and couple systems. Distributed force systems. Static analysis of trusses, frames and machines. Friction, impending motion. Methods of virtual work.

Prerequisite(s): PH 1013 and MA 1024. Corequisite(s): ME 2211.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 3211 Mechanics of Materials Laboratory**

1 Credits The course covers measurement of elastic constants for isotropic and anisotropic materials, verification of stress and strain transformation equations, stress concentration concept, unsymmetric bending of beams and torsion of shafts.

Corequisite(s): ME 3213.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

**ME 3213 Mechanics of Materials**

3 Credits The course examines the Concept of Stresses and Strains in two and three dimensions, Stress-strain relationships, Stress transformation, Strain transformation, Axial members, Torsion of shafts, Bending of beams.
ME 3223 Dynamics

3 Credits The course explores three-dimensional treatment of the kinematics of particles and rigid bodies using various coordinate systems, Newton’s laws, work, energy, impulse, momentum, conservative force fields, impact and rotation and plane motion of rigid bodies.

Prerequisite(s): MA 2132 and ME 2213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 3233 Machine Design

3 Credits This course introduces students to fundamentals of machine elements, enabling them to employ this knowledge to design machines for various practical applications. The course begins with a brief review of stress, deformation and failure, followed by friction and wear. Subsequently, loaded columns, pressurized cylinders and shafts are presented. Bearings, gears, screws, springs, brakes, clutches and belts are discussed. The course ends with an introduction to MEMS, Micro-Electro Mechanical Systems.

Prerequisite(s): ME 3213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 3311 Fluid Mechanics Laboratory

1 Credits The course covers fluid mechanics instrumentation and principles, and consists of a set of laboratory experiments designed to reinforce concepts presented in ME 3313 Fluid Mechanics. In addition, this course involves team work, report writing and oral presentations.

Corequisite(s): ME 3313.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

ME 3313 Fluid Mechanics

3 Credits This course introduces fluid kinematics, hydrostatics and thermodynamics. Topics: Basic conservation laws in integral form for a control volume. Conservation of mass, momentum, angular momentum and energy for flow. Inviscid flow: Bernoulli’s and Euler’s equations. Viscous flow: flows in pipes and ducts, head loss and friction factor.

Prerequisite(s): ME 3333, MA 2132 and MA 2122. Corequisite(s): ME 3311.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
ME 3323 Energy Systems

3 Credits This first course in power generation focuses on the analysis and design of energy-conversion systems. It will introduce students to fossil, nuclear and renewable-energy (including wind and solar) power plants with equal emphasis. Students gain a comprehensive and detailed understanding of the fundamentals of such systems and the issues related to their operation from economic, environmental and safety points of view.

Prerequisite(s): ME 3333.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 3333 Thermodynamics

3 Credits The course centers on properties of pure substances; concepts of work and heat; closed and open systems. Topics: Fundamental laws of thermodynamics. Carnot and Clasius statements of the 2nd law; entropy and entropy production; heat engines, refrigerators, heat pumps; efficiencies, coefficients of performance.

Prerequisite(s): PH 2033, MA 1124 and MA 2132.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 3411 Automatic Control Laboratory

1 Credits The course covers system ID, modeling, identification and control of RC electrical network and a DC servo motor, modeling and control of a maglev system, rotary inverted pendulum and a coupled water tank system.

Prerequisite(s): ME 3511. Corequisite(s): ME 3413.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

ME 3413 Automatic Control

Prerequisite(s): ME 3513 and ME 3223. Corequisite(s): ME 3411.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 3511 Measurement Systems Laboratory

1 Credits The course covers electric measurements, data acquisition, passive and active filters for signal conditioning, temperature, position, velocity and acceleration measurements.
Corequisite(s): ME 3513.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

ME 3513 Measurement Systems

3 Credits The course focuses on electrical circuits and components, filtering, dynamic measurement system response characteristics, analog signal processing, digital representation, data acquisition, sensors. Study of measurement systems via computer simulation.

Prerequisite(s): MA 2132 and PH 2023. Corequisite(s): ME 3511.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 3713 Manufacturing Systems I

3 Credits To be successful in the marketplace, a product must meet both customer needs and goals of performance, cost, quality, reliability, safety and the environment. The course addresses issues critical to the design of a product for manufacture and the methods that have been found to be successful in addressing these issues. The design process is studied and illustrated through class exercises and a term project. Selected manufacturing processes are studied. Economic feasibility, entrepreneur- ship and bringing products (and services) to the market are emphasized.

Prerequisite(s): PH 1013 and MA 1024.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4112 Senior Design I

2 Credits This is the first of two courses dedicated to the capstone design experience in mechanical engineering. In this first course, the students identify and define a project to design, build and test an engineering product or system and complete the preliminary design of their chosen system. The product-realization process, building effective teams and teamwork and communication skills are emphasized.

Prerequisite(s): ME 2112, ME 3233 and ME 3313. Corequisite(s): ME 4214, ME 4313 and ME 3413.
Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4113 Senior Design II

3 Credits This is the second of two courses dedicated to the capstone design experience in mechanical engineering and based on knowledge and skills acquired in earlier course work. Topics: Product design, development, building and testing prototype hardware, with an emphasis on teamwork. The Product Realization Process emphasizes incorporation of engineering standards and realistic constraints. The course concentrates on communication skills.

Prerequisite(s): ME 4112.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
ME 4213 Design and Fabrication of Composite Materials

3 Credits The course introduces composite materials. Topics: Introduction to types of reinforcements and matrix materials. Various applications in mechanical engineering. Manufacturing of polymer, metal and ceramic matrix materials. Analysis of laminated composites for mechanical properties.

Prerequisite(s): MT 2813, MT 2811 and ME 3213.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4214 Finite Element Modeling, Design and Analysis

4 Credits The analysis of complex static and dynamic problems involves three steps: selection of a mathematical model; analysis of the model; interpretation of the predicted response. The course deals with deriving analytical solutions and comparing them with Finite Element Analysis results. Students are required to use state-of-the-art commercial software.

Prerequisite(s): ME 3213, ME 3313, MA 2122 and MA 2132.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

ME 4311 Heat Transfer Laboratory

1 Credits The course covers heat-transfer instrumentation and principles and consists of a set of laboratory experiments designed to reinforce the concepts presented in ME 4313 Heat Transfer. In addition, this course involves team work, report writing and oral presentation.

Prerequisite(s): ME 3311. Corequisite(s): ME 4313.
Weekly Lecture Hours: 0.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1.5

ME 4313 Heat Transfer

Prerequisite(s): ME 3313. Corequisite(s): ME 4311.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4353 Internal Combustion Engines

ME 4363 Heating, Ventilation and Air Conditioning

3 Credits This course reviews thermodynamic principles, psychometric chart and psychometric analysis, comfort air conditioning and indoor air quality, heating and cooling system, HVAC system design and equipment selection.

Prerequisite(s): ME 4313.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4373 Introduction to Nuclear Engineering

3 Credits This is intended to be a required course for the Nuclear Engineering Concentration. It covers three basic areas: (a) reactor kinetics, as it pertains to neutron reaction associated with fissile materials, (b) power reactor systems, i.e. the various types of nuclear reactors in use and their basic operating principles, and (c) design principles for reactors and reactor systems.

Prerequisite(s): PH 3103.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4383 Introduction to Radiation Physics and Dosimetry

3 Credits Theory and practice of Radiation and Health Physics. Atomic and nuclear structure, X-ray and gamma radiation, interaction of ionizing radiation with matter, and effects of ionizing radiation on living tissue. The course also introduces the principles of radiation detection, radiation measurement, and external and internal dosimetry.

Prerequisite(s): PH 3103.
Also listed under: PH 3503.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4713 Manufacturing Systems II

3 Credits This course continues ME 3713. It addresses techniques of manufacturing systems that can be applied to business processes in a variety of industries to address bottlenecks, simulation, economic computations, design process and applications. This course builds from the readings and emphasizes project work. The course depends on effective teamwork and focuses on project work and presentations.

Prerequisite(s): ME 3713.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 4863 Corrosion and Non-Destructive Evaluation of Materials
3 Credits Mechanisms of corrosion and means to prevent corrosion; uniform corrosion, galvanic corrosion, pitting, leaching and corrosion in fresh water; protective coatings, cathodic protection and changes in design and environment to prevent corrosion. Non-destructive testing of materials; Penetrants, Magnetic, Radiography, Eddy Current and Ultrasonic techniques. Materials selection, failure analysis and prevention and design strategies for inspectability.

Prerequisite(s): PH 2023 Electricity, Magnetism and Fluids

**ME 4993 BS Thesis in Mechanical Engineering**

3 Credits Honors Program students can produce a BS Thesis on a topic of interest to them under faculty advisement. A research project is carried out in traditional and emerging areas of mechanical engineering. The course can be repeated for no more than 6 credits.

Prerequisite(s): Honors Program status and adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 5103 Biomedical Fluid Dynamics**

3 Credits The course focuses on principles of fluid flow and transport in the human body, emphasizing vascular circulation and hemodynamics. Topics include: physics of pulsatile flow, introductory biology and physiology of the circulatory system, blood flow in vessels, microcirculation, blood rheology, fluid dynamics of vasculature under physiological and pathological conditions, mass transport to vessel walls, mechanics of blood cells, cellular mechanotransduction and biochemical signaling and microfluidics in biomedical devices.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 5243 Composite Materials**

3 Credits This course introduces modern polymeric, metallic and ceramic composite materials, fabrication techniques, mechanical property characterization. Topics: Introduction to matrix and reinforcement materials, material selection and composite design criteria. Mechanics based analysis of continuous fiber reinforced unidirectional plies and woven fabrics. Applications of advanced composites in car, aircraft, construction and sports industries.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 5443 Vibrations**

3 Credits The course looks at the dynamics of one-, twoand multi-degree of freedom systems with and without damping. Topics: Vibrations of distributed parameter systems: bars, beams and plates. Numerical methods. Introduction to nonlinear oscillations.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
ME 5643 Mechatronics

3 Credits The course introduces theoretical and applied mechatronics, design and operation of mechatronics systems; mechanical, electrical, electronic and optoelectronic components; sensors and actuators, including signal conditioning and power electronics; microcontrollers, fundamentals, programming and interfacing; and feedback control. The course includes structured and term projects in designing and developing prototype integrated mechatronic systems.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 5653 Microelectromechanical Systems

3 Credits The course covers materials for MEMS, fundamentals of solid mechanics, electrostatics and electromagnetics. Topics: Electromechanical modeling and design of micromachined sensors and actuators. Microscale physics of microsystems. Overview of MEMS applications. Packaging and testing.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6003 Applied Mathematics in Mechanical Engineering

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6013 Thermodynamics

3 Credits The course covers availability functions, general thermodynamic relations, equations of state, general thermodynamic equilibrium criteria, power production, thermodynamics of reacting systems, energy of formation, chemical equilibrium, applications in combustion systems.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6043 Transport Phenomena

ME 6213 Introduction to Solid Mechanics

3 Credits The course explores fundamentals of kinematics of solid bodies; displacement and strain measures, introduction to statics of solid bodies, stress tensor, equilibrium equations. Topics include analysis of columns, beams and beams on elastic foundations.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6223 Advanced Mechanics of Materials

3 Credits The course discusses two-dimensional stress and strain analysis, applications of energy methods, Reyleighitz method. Topics: Applications of energy methods to beams, frames, laminates and sandwich structures. Torsion of prismatic bars, open and closed thin-walled cylinders, unsymmetric bending and shear center, curved bars.

Prerequisite(s): ME 6213 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6253 Mechanics of Nanomaterials

3 Credits The course introduces nanosized and nanoscale materials: nanoparticles, nanotubes, nanowires, nanorods. Topics: Classical molecular dynamics, lattice mechanics, methods of thermodynamics and statistical mechanics, introduction to multiple scale modeling and introduction to bridging scale. Characterization techniques for nanomaterials. Applications in nanosystems such as nanocars, nanobots and nanoelectronics.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6323 Microscopy & Microanalysis

Prerequisite(s): Prerequisite: Graduate standing

ME 6513 Advanced Dynamics

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6603 Digital Control Systems

3 Credits The course introduces digital systems, signal conversion techniques, z-transform and inverse z-transform, transfer function and block diagrams, state-variable techniques, controllability, observability, stability and control design techniques.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6613 Sensor Based Robotics

3 Credits Topics in this course include robot mechanisms, robot arm kinematics (direct and inverse kinematics), robot arm dynamics (Euler Lagrange, Newton-Euler and Hamiltonian Formulations), six degree-of-freedom rigid body kinematics and dynamics, quaternion, nonholonomic systems, trajectory planning, various sensors and actuators for robotic applications, end-effector mechanisms, force and moment analysis and introduction to control of robotic manipulators.

Prerequisite(s): Graduate status or adviser approval.
Also listed under: EL 5223.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 6623 Introduction to Robot Mechanics

Prerequisite(s): Prerequisites: ME 3223 and ME 3413, or instructor's consent.

ME 6703 Linear Control Theory and Design I

3 Credits The course covers modeling of mechanical systems (e.g., mechatronic, vibrational, robotic and smart systems) in state-space. Topics: Description and analysis of linear mechanical systems, transform and transition matrix methods and properties such as stability, controllability/ stabilizability, observability/ detectability.

Prerequisite(s): Graduate standing or advisor approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
ME 6713 Linear Control Theory and Design II

3 Credits The course considers fundamentals of system realizations and random processes. Topics: Performance objectives for mechanical systems (e.g., mechatronic, vibrational, robotic and smart systems). Optimal design of state feedback controllers, observers and output feedback controllers for mechanical systems.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7003 Finite Element Methods

3 Credits The course explores derivation of element stiffness matrices for spring, bar and beam elements. Topics: Finite element formulation to determine many unknowns such as displacements, forces and reactions. Application to trusses, frames and two-dimensional problems in plane stress and plane strain under static loading conditions. Applications in thermal, heat transfer and fluid mechanics. Interpreting the results, convergence of solution and effect of meshing and symmetry conditions. Introduction to modern meshless techniques.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7063 Convective Heat Transfer

3 Credits The course examines developments and applications of laminar hydrodynamic and thermal boundary layer equations for fluid media. Topics: Mechanics of turbulence; formulation and analysis of turbulent hydrodynamics and thermal applications; natural convection and film evaporation and condensation.

Prerequisite(s): ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7073 Conductive Heat Transfer

3 Credits This course covers theoretical development of transient and steady-state temperature distributions in finite and infinite solids. Topics: Pertinent mathematical techniques introduced as required. Solids undergoing phase change and two dimensional fields.

Prerequisite(s): ME 6003 and ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7083 Radiative Heat Transfer

3 Credits This course covers fundamentals of radiative mechanisms of energy transfer. Topics: Definitions of basic qualities. Equations of transfer, radiative heat flux vector and conservation equations. Properties of surfaces and participating media.
Applications to engineering systems.

Prerequisite(s): ME 6003 and ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7113 Viscous Flow and Boundary Layers

Prerequisite(s): ME 6003 and ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7123 Turbulent Flow

Prerequisite(s): ME 6043 and ME 7113 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7133 Compressible Flow

3 Credits The course examines fundamentals of compressible fluid flow, including subsonic, transonic, supersonic and hypersonic flows over two-dimensional and axisymmetric bodies. Topics: One-dimensional flows with friction and heat addition. Shock-wave development in both two-dimensional steady and onedimensional unsteady flow systems, including flow in shock tubes. Quasi-one-dimensional compressible flow, including flows in inlets, nozzles and diffusers. Introduction to numerical solution of compressible fluid flow.

Prerequisite(s): ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7153 Computational Fluid Mechanics and Heat Transfer

3 Credits The course centers on engineering solution of thermo-fluid problems by finite-difference methods, error and stability analyses, numerical dispersion and damping, matrix inversion methods, solution of model equations: wave, heat, Laplace, viscous and inviscid Burger’s equations. Also covered are implicit and explicit procedures, SOR, ADI, hopscotch and direct solvers for evaluating linear and nonlinear diffusion and convection problems.

Prerequisite(s): ME 6003 and ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
ME 7163 Experimental Methods in Thermal-Fluid Sciences

3 Credits The course discusses basic measurement techniques in thermal and flow sciences and a survey of the modern developments in measurement technology, including optical methods. Topics: Planning of experimental programs, calibration, measurement uncertainty, noise, generalized performance characteristics, various devices for measuring mass and volume-flow rate, velocity, pressure, temperature, density and heat flux, computerized data acquisition and statistical analysis.

Prerequisite(s): ME 6043 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7213 Elasticity I

3 Credits The course looks at stress and strain tensors, generalized Hooke’s law. Topics: Formulation of elasticity problems. Plane stress and plane strain concepts; solution by complex variables; stress concentrations. Rotating Discs and cylinders of uniform thickness and variable thickness. Deformation symmetrical about an axis.

Prerequisite(s): ME 6213 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7243 Advanced Composite Materials

3 Credits The course covers mechanics based analysis of fibrous (continuous and discontinuous) and particulate composites, generalized Hooke’s law for anisotropic and orthotropic materials. Topics: Stress strain transformations and failure criterion for anisotropic materials. Analysis of composite beams in tension, flexure and torsion. Analysis of composite shells and grid-stiffened structures.

Prerequisite(s): ME 6213 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7323 Failure Mechanics

Prerequisite(s): ME 6213 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7333 Non-Destructive Evaluation (NDE)

3 Credits The course introduces various NDE techniques used in engineering applications, x-ray radiography, ultrasonic imaging, acoustic emission, optical interferometry, magnetic resonance imaging. Also introduced are embedded optical and
electromechanical sensors for continuous health monitoring and defect detection.

**Prerequisite(s): ME 6003 or adviser approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 7353 Fracture Mechanics**

**Prerequisite(s): ME 6213 or adviser approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 7443 Advanced Vibrations**

*3 Credits* This course reviews analytical dynamics and vibrations of lumped parameter systems. Topics: Vibrations of distributed parameter systems. Approximate solution methods. Introduction to nonlinear vibrations and analysis tools. Advanced topics.

**Prerequisite(s): ME 5443 or adviser approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 7613 Nonlinear Systems: Analysis and Control**

*3 Credits* The course introduces nonlinear phenomenon, behavior and analysis of second-order nonlinear systems, fundamental properties of solutions of nonlinear ordinary differential equations, Lyapunov stability theory, absolute stability theory, describing functions, dissipativity, advanced topics.

**Prerequisite(s): ME 6003 and ME 6713 or adviser approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 7623 Cooperative Control**

**Prerequisite(s): ME 6003 and ME 6703 or adviser approval.**
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**ME 7703 Optimal Robust Control**
3 Credits The course looks at mathematical preliminaries, matrix theory fundamentals, linear system properties, stability theory, constrained optimization and performance characterization: deterministic/stochastic formulations, Lagrange multiplier versus linear-matrix-inequality formulation of linear quadratic regulation (LQR), state estimation and dynamic output feedback control problems, static output feedback, regulation versus tracking problems, robustness properties of LQR, on lack of robustness of LQG controllers, loop-transfer recovery, small-gain theorem, introduction to H-infinity and multi-objective robust control.

Prerequisite(s): ME 6703 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7863 Special Topics

3 Credits These course numbers are reserved for special topics offered periodically by the Mechanical Engineering Program and are open to first year graduate students. When offered, the subject matter is indicated as part of the title after the words “Special Topics,” and the complete title appears on the student’s transcript.

Prerequisite(s): tailored to the offering, and adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 7873 Special Topics

3 Credits These course numbers are reserved for special topics offered periodically by the Mechanical Engineering Program and are open to first-year graduate students. When offered, the subject matter is indicated as part of the title after the words “Special Topics,” and the complete title appears on the student’s transcript.

Prerequisite(s): tailored to the offering. Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 8033 Combustion

3 Credits The course covers chemical characteristics of flames. Topics: Heat of formation and of reaction; phase and reaction equilibrium and adiabatic flame temperature; and special concentration in stationary and flowing reacting systems. Chemical kinetics of homogeneous and heterogeneous reacting systems. Branching chain reactions and explosion limits. Diffusion and remixed combustion systems.

Prerequisite(s): ME 6043 and ME 6013 or adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 8043 Theory of Propulsion

3 Credits This course looks at principles of high-speed propulsion based on chemical energy sources. Topics: Air-breathing engines and their components: ramjet, scramjet, turbojet and turbofan, combustion thermodynamics, flows with chemical reactions, thermo-chemistry of solid and liquid rocket engines. Engineering parameters in engine design.
Prerequisite(s): ME 7133.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 8213 Elasticity II

3 Credits This class continues studies in elasticity problems. Topics: Three dimensional problems; St. Venant problems, extension, flexure, tension. Energy principles and variational methods; approximation techniques.

Prerequisite(s): ME 7213 or advisor approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 8273 Mechanics of Cellular Materials

3 Credits The course looks at structure of cellular composites and natural cellular materials, including single phase open and closed cell foams and two-phase closed cell foams. Topics: Mechanics of honeycombs and foams, mechanics of wood and bones, effect of density, cell size and cell periodicity, introduction to homogenization techniques for cellular composites.

Prerequisite(s): ME 7213 or advisor approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 8863 Advanced Topics

3 Credits These numbers are reserved for advanced topics offered periodically by the Mechanical Engineering Program and are open to second-year and more advanced graduate students. When offered, the specific subject matter is indicated as part of the title after the words “Advanced Topic,” and the complete title appears on the student’s transcript.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 8873 Advanced Topics

3 Credits These numbers are reserved for advanced topics offered periodically by the Mechanical Engineering Program and are open to second-year and more advanced graduate students. When offered, the specific subject matter is indicated as part of the title after the words “Advanced Topic,” and the complete title appears on the student’s transcript.

Prerequisite(s): Adviser approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

ME 9013 Guided Readings I

3 Credits These readings are open to qualified graduate students interested in special advanced topics. Directed study includes analytical work and/or laboratory investigations.
Prerequisite(s): Adviser and instructor approval.

ME 9023 Guided Readings II

3 Credits These readings are open to qualified graduate students interested in special advanced topics. Directed study includes analytical work and/or laboratory investigations.

ME 9033 Guided Readings III

3 Credits These readings are open to qualified graduate students interested in special advanced topics. Directed study includes analytical work and/or laboratory investigations.

ME 9043 Guided Readings IV

3 Credits These readings are open to qualified graduate students interested in special advanced topics. Directed study includes analytical work and/or laboratory investigations.

ME 9963 MS Project in Mechanical Engineering

3 Credits This course is an engineering project under faculty guidance. A written project proposal and final report must be submitted to the department head and the adviser and may be extended to a thesis with the project adviser’s recommendation. Credit only upon completion of project.

Prerequisite(s): Degree status.

Media Studies

MD 2163/W Media Studies 1

3 Credits This historical survey of media, from oral culture to the Internet, is a foundation for analyzing the historical and contemporary media practices and provides vital critical tools for creative professionals in a dynamic culture.
Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

MD 2213/W Cinema 1895–1950

3 Credits This critical survey of cinema, from the Lumière brothers to the immediate post–World War II period, covers genres including short and feature formats in documentary, drama and animation. Works will be examined in detail, with attention to their place in the development of the form and their cultural and social context.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

MD 3163/W Media Studies II

3 Credits Where MD 2163/W was primarily a historical orientation to media communications, this course is its complement: a critical orientation. Drawing on their evolving research, discursive and creative skills, students in MD 3163 are expected to consider contemporary media-communications practices as integral parts of an ongoing global cultural process, with all of the potential that implies.

Prerequisite(s): MD 2163/W.
Note: Satisfies a humanities and social sciences elective.

MD 3213/W Cinema 1948–2000

3 Credits This course is a critical survey of cinema from in immediate post–WWII period to 2000. Genres covered will include documentary, comedy, drama and experimental. Works will be discussed in detail in terms of their place in the development of the form, and in terms of their cultural and social context. Each week, students will view the assigned film before class for details formal analysis and critical context in class. The course will be organized thematically; each week, a selection of alternate films will be offered for additional viewing and essay topics.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H, and a 2000-level humanities and social sciences course.
Note: Satisfies a humanities and social sciences elective.

MD 4163/W Media Studies III

3 Credits This seminar, a synthesis of the historical and critical approaches developed in the prerequisites, MD 2163/W and MD 3163/W, asks students to participate actively and to consider key aspects of media in depth.

Prerequisite(s): MD 3163/W.
Note: Satisfies a humanities and social sciences elective.
MD 4911 Special Topics in Media Studies

*Variable Credits* This advanced seminar looks at contemporary developments in media communications from a global perspective. Students are expected to participate actively through presentations on specific subjects and through vigorous seminar discussion and debate.

*Prerequisite(s):* MD 3163/W.

*Note:* Satisfies a humanities and social sciences elective.

MD 4912 Special Topics in Media Studies

*Variable Credits* This advanced seminar looks at contemporary developments in media communications from a global perspective. Students are expected to participate actively through presentations on specific subjects and through vigorous seminar discussion and debate.

*Prerequisite(s):* MD 3163/W.

*Note:* Satisfies a humanities and social sciences elective.

MD 4913 Special Topics in Media Studies

*Variable Credits* This advanced seminar looks at contemporary developments in media communications from a global perspective. Students are expected to participate actively through presentations on specific subjects and through vigorous seminar discussion and debate.

*Prerequisite(s):* MD 3163/W.

*Note:* Satisfies a humanities and social sciences elective.

Music

Music

MU 2113 Western Music Theory

*3 Credits* This course, an introduction to the fundamentals of Western music theory, focuses on nomenclature, basic notation literacy and fundamentals of harmony, counterpoint and rhythm. Students complete weekly exercises to learn basic skills in composition and musicianship, including dictation, sight-singing, chord analysis and identification, transposition and voice-leading.
MU 2213 Non-Western Music Appreciation

3 Credits This analysis-and-discussion course examines the music of non-Western cultures, from the pre-Colonial period through the present day. The course focuses on performance practices, the relationship between music and the arts, the influence of Western music and technology, and hybridity in contemporary popular music. A topical focus on different cultures will look at the musical traditions of the Middle East, North and Sub-Saharan Africa, India and East and Southeast Asia. Students complete regular listening assignments and perform research on musical styles and traditions.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

MU 3113 Music Since 1900

3 Credits This course examines the development of musical instruments from ancient to modern times, looking at the relationship between technology and society as it expresses itself in musical culture. Topics include the development of the “classis” orchestral instrument families (strings, percussion, woodwind, brass), non-Western instrumental evolution (gamelan, Arabic instruments), the impact of industrialization and the rise of electronic and digital technology. Students will perform research on the relationship between technology and performance practice.

Prerequisite(s): MU 2113.
Note: Satisfies a humanities and social sciences elective.

MU 3133 Music Theory for Songwriters

3 Credits In this introduction to music theory as it applies to songwriting, students compose music and lyrics, building on a practical application of scale, chord and harmony theory. An integral part of the course is an introduction to the craft of poetry as applied to song-lyric writing. Students need free access to a guitar or piano, and some experience on either instrument is preferred. However, neither formal training nor technical proficiency is required.

Prerequisite(s): Instructor’s permission or MU 2113.
Note: Satisfies a humanities and social sciences elective.

MU 3213 The Musical Instrument

3 Credits This course, on the art music of the 20th century, focuses on social and historical trends and their impact on developments in compositional practice, instrumental forms and technology. Topics covered include the role of nationalism in music, the European serialist avant-garde, the New York School, the changing nature of the composer in society, the increasing role of technology and the musical dialogue between art and popular music. Students complete regular listening and writing assignments and are required to attend performances outside of class.
MU 3313 Phonography

3 Credits This course looks critically at the development of recording technology as a catalyst for trends in popular and art music, from the early 20th century to the present. Topics include the rise (and possible fall) of the record industry in the United States, the development of musique concrète and electroacoustic music and the massive impact of recording technology on popular urban, electronic and dance music. Students are encouraged to explore how the artistic practices of sampling, dubbing and remixing have expressed themselves in different genres, scenes and musical styles. The course also looks at current legal, ethical and social issues behind musical copyright and distribution.

Prerequisite(s): MU 2113.
Note: Satisfies a humanities and social sciences elective.

MU 4113 Musical Informatics Studio

3 Credits This studio examines how music and sound actually “work,” from the view of mathematics, physics and information theory. This is a music-theory course in reverse. The class looks at the underlying mathematical principles behind harmony, melody, rhythm (and their “scientific” equivalents of frequency, timbre and duration). Using acoustics, instrument design and basic analog and digital-signal theory, students investigate the properties of music from a scientific, engineering and analytic perspective. Students perform research on topics of interest and present their findings semiweekly.

Prerequisite(s): MU 3XXX or DM 3113.
Note: Satisfies a humanities and social sciences elective.

MU 4211 Special Topics in Music

Variable Credits This variable-credit intensive course, combining music theory and practice, may be repeated for credit under different topics.

Prerequisite(s): MU 3XXX.
Note: Satisfies a humanities and social sciences elective.

MU 4212 Special Topics in Music

Variable Credits This variable-credit intensive course, combining music theory and practice, may be repeated for credit under different topics.

Prerequisite(s): MU 3XXX.
Note: Satisfies a humanities and social sciences elective.
MU 4213 Special Topics in Music

Variable Credits This variable-credit intensive course, combining music theory and practice, may be repeated for credit under different topics.

Prerequisite(s): MU 3XXX.
Note: Satisfies a humanities and social sciences elective.

MU 4313 Psychoacoustics

3 Credits This course looks at how people hear and listen to sound and music from a physiological, psychological and sociological frame of reference. The class investigates the basics of human hearing and auditory perception and examines how sonic and musical practices and vocabularies evolve based on how people hear. Students perform basic research (including developing simple experiments) and present their findings semiweekly.

Prerequisite(s): MU 3XX3.
Note: Satisfies a humanities and social sciences elective.

Philosophy

PL 2003 Symbolic Logic

3 Credits This course introduces the methods and applications of propositional logic and relational predicate logic. The course looks at the concept of a formal language and covers semantic and proof-theoretic methods of testing arguments for validity. Semantic concepts of tautology, logical equivalence and consistency are compared with their proof-theoretic counterparts, and the notions of soundness and completeness of proof-theoretic methods are introduced.

Note: Satisfies a humanities and social sciences elective.

PL 2013/W Ancient Greek Philosophy

3 Credits This introduction to ancient philosophy in the Western tradition covers the pre-Socratic philosophers Plato and Aristotle. The course unites them in a dialogue, highlighting their similarities and differences to show their importance in the history of philosophy and their relevance to society today. The course emphasizes the history and methods of early Greek science and examines Greek attitudes toward technology and their implications for science and society.
PL 2023/W Early Modern Philosophy in Europe

3 Credits This course examines the central figures and issues of the Modern era, especially the European scientific and ontological revolution of the 16th, 17th and 18th centuries. The course focuses on issues that were in those eras and that remain important today, including the state of nature and society, epistemology, metaphysics and the role of God in philosophical and scientific thinking. Topics include the Renaissance and the rise of modern science, Descartes and rationalism, Locke, Berkeley, Hume and empiricism and Kant and the Copernican revolution.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2103/W Philosophy of Science, Technology and Society in China and India

3 Credits This course addresses the fundamental questions of philosophy—What is real? What is good? How do we know?—by considering the answers by classical philosophers from India and China. Philosophy in Asia has not been viewed as an abstract academic subject with little or no relevance to daily life. Rather, it has been seen as one of life’s most basic and important enterprises. Philosophy is seen as essential to overcoming suffering and improving the quality of human life. Since Asian philosophy is concerned with practical issues to a greater extent than in the West, the course considers how technology is understood and valued. Attention is given to the history of science in China and India. Since no rigid distinctions exist between philosophy and religion in Asian thought, the place of science and technology in relation to human values is also different. The class examines the Asian philosophical tradition to understand both its historical importance and its relevance to society today.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2113/W Philosophy of Religion

3 Credits This course investigates religious concepts, belief systems and practices. By analyzing central concepts of religion—such as God, faith, revelation, salvation and the relationships between religion and science and morality and art—both believers and non-believers can achieve a more sophisticated understanding and appreciation of religions. The course considers the epistemological status of religious language (e.g., propositions that refer to God). The class addresses such topics as the phenomenology of religious experience, faith and reason, arguments for God’s existence, the problem of evil, religious language, life and the after-life and the conflicting claims of different religions. Special attention is given to the dialogue between science and religion today.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2143 Ethics and Technology
3 Credits This course considers how technology shapes and patterns—and is shaped and patterned by—human activities, from a moral point of view. This course focuses on how the technologically textured world changes human life, individually, socially and culturally, for better or worse. The course considers several views of technology and several ethical theories for evaluating technology. The course explains the structures of change and transformation and develops critical forms of thought, so that students can understand, evaluate, appreciate and criticize technological development.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2203 Philosophy of Technology

3 Credits This survey of prominent approaches to the philosophy of technology asks: What are the philosophical problems presented by technology? How does technology influence ethics, politics and society? What is the relation of philosophy of technology to the traditional branches of philosophy (aesthetics, epistemology, metaphysics)?

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2243/W Thinking About the Environment

3 Credits This survey of contemporary environmental issues emphasizes developing the reasoning skills needed for informed judgments. Topics include the history of environmentalism in the United States, the global character of the environmental crisis and special topics, including atmospheric ozone, global warming, acid rain, air pollution, global population growth, pesticides, nuclear power, alternative energy, biodiversity and species extinction and genetically modified crops. The limits of technology to resolve environmental problems is also addressed.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2253/W Science and Pseudoscience

3 Credits This survey of popular pseudoscientific claims emphasizes issues in the philosophy of science, including demarcation, evidential warrant, scientific progress, science and public policy, and fallacies of reasoning. Topics include UFO sightings and alien abductions, the Nemesis theory of dinosaur extinctions, astrology, creationism, psychic phenomena, theories of intelligence, alternative medicines, global warming and cold fusion. The course emphasizes student input to determine the topics covered.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PL 2273/W Space and Spacetime

3 Credits What is the nature of space? Is it an independently existing substance, or does it merely consist of the relations between physical objects? Can motion be described simply in terms of the relational properties of objects, or must people always define motion with respect to an absolute motionless substratum? Does the existence of left-handed gloves entail the existence of
absolute space? This course considers these and other questions about the nature of space and time as they appear in the writings of philosophers and scientists, including Plato, Aristotle, Descartes, Newton, Leibniz, Berkeley, Kant, Poincaré and Einstein.

**Prerequisite(s):** EW 1023 or EN 1233W or EN 1203H.

*Note:* Satisfies a humanities and social sciences elective.

---

**PL 2283/W Philosophy of Relativity**

3 Credits The first part of this course develops the physics underlying special relativity and considers such conceptual questions as: Does Special Relativity prohibit faster-than-light travel? Does it allow a traveling astronaut to age less and return home in the distant future? What is the significance of Einstein’s famous equation "E = mc²"? The second part of the course develops the physics underlying general relativity and considers conceptual issues surrounding such current applications as time machines, wormholes and "warp-drive" space-times.

**Prerequisite(s):** EW 1023 or EN 1233W or EN 1203H.

*Note:* Satisfies a humanities and social sciences elective.

---

**PL 2293/W Philosophy of Quantum Mechanics**

3 Credits Quantum mechanics is today the best-confirmed theory of particle dynamics. The theory is not only the basis for all digital technologies, but also the theoretical foundation for the best-confirmed theories of matter (quantum field theories). However, since its inception, quantum mechanics has been beset with conceptual problems. No consensus exists on how to interpret it: What would the world be like if it were true? This course develops the mathematical formalism of the theory and explores several proposals about how to interpret it. Other topics include conceptual issues of quantum teleportation, quantum computing and quantum cryptography.

**Prerequisite(s):** EW 1023 or EN 1233W or EN 1203H.

*Note:* Satisfies a humanities and social sciences elective.

---

**PL 3003 Metalogic**

3 Credits What is the relation between truth and proof? Are there true statements about natural numbers that cannot, in principle, be proven? Can an algorithm be written to decide which statements about numbers are provable and which are not? What is the mathematical basis of the concept of a mechanically implementable algorithm (i.e., a computer program)? What does all of this have to do with logic? This course addresses these and other questions by investigating the properties of propositional and 1st-order logic. Topics include the soundness and completeness of formal systems of propositional and 1st-order logic, the Löwenheim-Skolem and Compactness theorems for 1st-order logic, Gödel’s incompleteness theorems for formal arithmetic, and Turing machines and the notions of computability and undecidability.

**Prerequisite(s):** PL 2003 or permission of the instructor.

*Note:* Satisfies a humanities and social sciences elective.

---

**PL 3103/W Philosophy East and West**
Philosophy develops in different ways in different cultures. Because philosophy aims to be universal and to address fundamental issues without cultural bias, these differences in philosophical development raise important questions. This course introduces the classical problems of philosophy from traditionally Eastern and Western perspectives. Standard readings from Greek and Roman, European and American philosophy are compared with parallel texts from other traditions, including Arabic, Chinese and Indian. Science and technology development in each tradition is also covered.

Prerequisite(s): One level 2 SEG cluster course.
Note: Satisfies a humanities and social sciences elective.

PL 3103W Philosophy East and West

Philosophy develops in different ways in different cultures. Because philosophy aims to be universal and to address fundamental issues without cultural bias, these differences in philosophical development raise important questions. This course introduces the classical problems of philosophy from traditionally Eastern and Western perspectives. Standard readings from Greek and Roman, European and American philosophy are compared with parallel texts from other traditions, including Arabic, Chinese and Indian. Science and technology development in each tradition is also covered.

Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

PL 3203/W Philosophy of Technology: The Critique of Heidegger

This course examines, critically and reflectively, the impact, effects and outcomes of technologies upon human activities. The course studies the nature of the technologically textured ecosystem, or techno-system. The course focuses on how technologies change human life, individually, socially and culturally, and considers the effects of human-technology relations on science, culture, democracy and human values. Emphasis is on the position of Heidegger, his predecessors, followers and critics. The course will examines Heidegger’s unusual interpretation of East Asian philosophy in relation to technology. Heidegger claimed to find merit in Eastern thought, and his critique of Western technology is seen in an Eastern philosophical context.

Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

PL 3213 The Phenomenon of Life

This course offers an existential interpretation of biological facts. The problem of inwardness as examined in modern philosophy is addressed from the standpoint of scientific biology. The course approach is not be limited by the anthropocentric tradition of idealist and existentialist philosophy, nor the materialist standards of natural science. The course explores the great contradictions of human experience—freedom and necessity, autonomy and dependence, self and world, creativity and mortality—through the ascending order of organic powers and functions: metabolism, motility, desiring, sensing and perceiving and on to imagination, art and mind.

Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

PL 3253/W Philosophy of Science
The philosophy of science is divided into two subfields: The first studies the nature and methodology of science. The second examines the conceptual and philosophical foundations of particular scientific fields. This course considers topics in the first subfield, including philosophical attempts to describe scientific explanations, laws of nature and the process by which evidence confirms theories in science. The course also considers the nature of scientific theories: what they are, how they change and how they can and should be interpreted.

Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

PL 3263/W Physics Information and Computation

This course investigates the conceptual foundations of contemporary notions of information and computation from the point of view of physics. The course is divided into four parts: Part I considers the relation between entropy and global concepts of information; Part 2 considers the relation between space-time structure and physical concepts of computation; Part 3 considers the relation between quantum and classical information; and Part 4 considers attempts to reconceive physics entirely in information-theoretic terms.

Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

Physics

PH 1 Pre-college Physics

This course introduces the foundational concepts and laws of physics and their connection to the engineering disciplines. The subject matter helps students apply scientific methods to physical problems and prepares them for physics at the university level. Topics include vectors, kinematics, Newton’s Laws, work and energy, momentum and collision theory, rotational motion, and angular momentum.

Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

PH 997X MS Thesis in Physics

Independent research project performed under guidance of thesis adviser. Bound thesis volume and oral defense in presence of at least three faculty members. Continuous registration with total 9 credits required.
PH 999X PhD Dissertation in Physics

3 Credits An original investigation in some branch of physics, which may serve as basis for the MS or PhD degree, is performed under the direction of a member of the department. The number of research credits registered for each semester should realistically reflect the time devoted to research.

Prerequisite(s): Degree status and graduate advisers and research director’s consent.

PH 1002 Physics: The Genesis of Technology

2 Credits This course introduces contemporary topics in physics, along with readings and discussions of topics with technological implications.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 1013 Mechanics

3 Credits This course is the first of a three-semester lecture sequence in general physics for science and engineering students. Motion of particles and systems of particles. One-dimensional motion. Vectors and two-dimensional motions. Forces and acceleration. Conservation of energy and momentum. Rotations. The free and driven harmonic oscillator. Gravitation. (This class meets four hours per week for lectures and recitation.)

Prerequisite(s): MA 1024 or an approved equivalent. Corequisite(s): MA 1124 or approved equivalent and EG 1 Examination Hour.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

PH 1213 Motion and Sound

Corequisite(s): MA 1024.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

PH 1223 Electricity and Light

**PH 2021 Introductory Physics Laboratory I**

*0.5 Credits* This course is the first of a two-semester sequence. Introduction to the science of measurement and data analysis. Accompanies PH 2023. Experiments cover topics from PH 1013 and PH 2023.

Prerequisite(s): PH 1013 and MA 1124 or an approved equivalent. Corequisite(s): PH 2023.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

**PH 2021H Honors Introductory Physics Lab I**

*0.5 Credits* First part of introduction to the science of measurement. Students perform experiments chosen to illustrate basic physical principles and requiring a variety of measurement techniques and equipment. Results require progressively more detailed and sophisticated analysis. This course treats the same topics as PH 2021 but because of the intended audience, in greater depth.

Prerequisite(s): Enrollment in Honors Program, PH 1013 and MA 1124 or an approved equivalent. Corequisite(s): PH 2023H and EG 1 Examination Hour.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

**PH 2023 Electricity, Magnetism and Fluids**

*3 Credits* This is the second course of a three-semester lecture sequence in general physics for science and engineering students. Fluids at rest and in motion. An introduction to electric and magnetic forces and fields. Electric charge density. Electric fields from simple charge distributions. Electric potential. Capacitance. Magnetic forces. Magnetic field from a current loop. Inductance. Magnetism in matter. Current and resistance. (This class meets four hours per week for lectures and recitation.)

Prerequisite(s): PH 1013 and MA 1124 or an approved equivalent. Corequisite(s): PH 2021 and EG 1 Examination Hour.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

**PH 2023H Honors Electricity, Magnetism and Fluids**

Prerequisite(s): PH 1013H and MA 1124 or an approved equivalent and enrollment in the Honors Program. Corequisite(s): PH 2021H and EG 1 Examination Hour.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1
PH 2031 Introductory Physics Laboratory II

0.5 Credits This is the second course of two-semester sequence. Continuation of the introduction to the science of measurement and data analysis. The course accompanies PH 2023. Experiments cover topics from PH 2023 and PH 2033.

Prerequisite(s): PH 2021 and PH 2023. Corequisite(s): PH 2033.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

PH 2031H Honors Introductory Physics Lab II

0.5 Credits Continuation of introduction to the science of measurement. Students perform experiments chosen to illustrate basic physical principles and requiring a variety of measurement techniques and equipment. Results require progressively more detailed and sophisticated analysis. This course treats the same topics as PH 2031 but because of the intended audience, in greater depth.

Prerequisite(s): Enrollment in Honors Program, PH 2021H and PH 2023H. Corequisite(s): PH 2033H and EG 1 Examination Hour.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 1.5 | Weekly Recitation Hours: 0

PH 2033 Waves, Optics and Thermodynamics

3 Credits This is the third course of a three-semester lecture sequence in general physics for science and engineering students. Water, sound and electromagnetic waves. Reflection, scattering and absorption. Standing waves and spectra. Superposition, diffraction and beats. Geometrical optics. Introduction to thermodynamics; temperature, heat, and entropy. (This class meets four hours per week for lectures and recitation.)

Prerequisite(s): PH 2021 and PH 2023. Corequisite(s): PH 2031 and EG 1 Examination Hour.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

PH 2033H Honors Waves, Optics and Thermodynamics

3 Credits Water, sound, and electromagnetic waves. Reflection, scattering, and absorption. Standing waves and spectra. Superposition, diffraction and beats. Geometrical optics. Introduction to thermodynamics; temperature, heat, and entropy. This course treats the same topics as PH 2033 but because of the intended audience, in greater depth.

Prerequisite(s): Enrollment in Honors Program and PH 2023H. Corequisite(s): PH 2031 and EG 1 Examination Hour.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

PH 2104 Analytical Mechanics

4 Credits This course covers statics by virtual work and potential energy methods. Stability of equilibrium. Particle dynamics, harmonic oscillator and planetary motion. Rigid body dynamics in two and three dimensions. Lagrangian mechanics. Dynamics of oscillating systems.
PH 2344 Introduction to Modern and Solid State Physics

Prerequisite(s): PH 2023. Corequisite(s): PH 2033.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 2813 Astronomy and Astrophysics

3 Credits  This course covers historical development of observational astronomy. Traditional and modern observational techniques. Theories of formation and evolution of stars, planets and galaxies. Current developments in astronomy, cosmology and astrophysics.

Prerequisite(s):
PH 2033 and PH 2031.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 2813 Astronomy and Astrophysics

3 Credits  This course covers the historical development of observational astronomy. Traditional and modern observational techniques. Theories of formation and evolution of stars, planets and galaxies. Current developments in astronomy, cosmology and astrophysics.

Prerequisite(s): PH 2033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3054 Introduction to Polymer Physics

4 Credits  This course introduces polymer physics and its applications in engineering. The course includes polymer assemblies, morphology and motion, mechanical and dielectric response, transitions and relaxations, timetemperature equivalence, yield and fracture, conducting polymers, optics of polymers, oriented structures, nanofibers, composites.
PH 3103 Fundamentals of Applied Nuclear Physics

3 Credits This course surveys the fundamentals of nuclear physics with application to nuclear engineering. Topics include an introduction to quantum mechanics, nuclear forces and nuclear structure, nuclear stability and reactions, natural and induced radioactivity.

Prerequisite(s): CM 1004, PH 2033 and MA 2132.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3234 Electricity and Magnetism

4 Credits The course covers properties of the electrostatic, magnetostatic and electromagnetic field in vacuum and in material media. Maxwell’s equations with applications to elementary problems.

Prerequisite(s): MA 2122 and PH 2033.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3244 Concepts of Nanotechnology

4 Credits This course is the first of an interdisciplinary, two-semester sequence on concepts, techniques and applications of nanotechnology. Introduction to nanotechnology, examples of nanoscale systems. Systematics in miniaturization from the mm to the nm scale. Limits to miniaturization. Quantum concepts and elementary Schrodinger theory. Quantum effects in the behavior of chemical matter. Examples of self-assembled nanosystems from nature and from contemporary industrial products.

Prerequisite(s): PH 2033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

PH 3423 Light and Lighting

Prerequisite(s): CM 1004 and PH 2033.
Also listed under: EE 3423
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3474 Introduction to Modern Optics

Prerequisite(s): PH 2033 or equivalent.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3503 Introduction to Radiation Physics and Dosimetry

3 Credits The course examines the basic theory and practice of Radiation and Health Physics. Atomic and nuclear radiation. X-ray and gamma radiation. Interaction of radiation with matter, and the effects on living tissue. Principles of radiation detection, radiation measurement, external and internal dosimetry. Radiation Protection.

Prerequisite(s): PH 3103 or PH 2344.
Also listed under: ME 4383.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3513 Nuclear and Radiation Instrumentation and Methods

3 Credits An intermediate level undergraduate course focusing on the theory and practice of nuclear and radiation measurements and instrumentation. Detector properties and principles, pulse electronics and counting statistics will be discussed in detail in the lecture classes. The experiments will illustrate the lecture topics and compliment the companion theory courses. This course meets five hours per week.

Prerequisite(s): PH 3103 Corequisite(s): PH 3503
Weekly Lecture Hours: 1 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 4

PH 3603 Mathematical Physics

Prerequisite(s): PH 2033 and MA 2122.
Also listed under: MA 3603.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 3614 Computational Physics

4 Credits An introduction to numerical methods. Solving ordinary differential equations, root finding, Fourier transforms, numerical integration, linear systems. Techniques are applied to projectile motion, oscillatory motion, planetary motion, potentials and fields, waves, and quantum mechanics.
Prerequisite(s): CS 1133 (or CS 1114), MA 2132 (or an approved equivalent) and PH 2344.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 3801 Guided Studies in Physics**

1 Credits These guided studies courses in physics are supervised by staff member.

Prerequisite(s): Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 3802 Guided Studies in Physics**

2 Credits These guided studies courses in physics are supervised by staff member.

Prerequisite(s): Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 3803 Guided Studies in Physics**

3 Credits These guided studies courses in physics are supervised by staff member.

Prerequisite(s): Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 3804 Guided Studies in Physics**

4 Credits These guided studies courses in physics are supervised by staff member.

Prerequisite(s): Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 4124 Thermodynamics and Statistical Physics**

4 Credits The course covers fundamental laws of macroscopic thermodynamics, heat, internal energy and entropy. Topics include an introduction to statistical physics, and applications of Maxwell, Fermi-Dirac and Bose-Einstein distributions.

Prerequisite(s): MA 2122 and PH 2344.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
PH 4244 Techniques and Applications of Nanotechnology

4 Credits This is the second of a two-course sequence on concepts and techniques of nanotechnology. Novel function and performance can occur with materials or devices of size scales of one to 100 nanometers, a range extending from molecular scale to that of typical linewidths in contemporary microelectronics. Nanosystems may provide entirely new functions, by virtue of access enabled by the small size. Photo and x-ray lithographic patterning. Scanning probe microscopes for observation and for fabrication. Molecular machines as envisioned by Drexler. The role of Van der Waals force. Questions of machine manufacturability on the nm scale. The IBM GMR hard-drive read head. Micro- and nanoelectromechanical devices and systems. Singleelectron electronics. Molecular electronics.

Prerequisite(s): PH 3244.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

PH 4364 Introduction to the Quantum Theory

4 Credits The course gives a quantitative introduction to the quantum theory, which describes light, electrons, atoms, nuclei and solid matter. Superposition principle, expectation values, momentum operator and wave function, duality, current vector, Hermitian operators, angular momentum, solution of the radial equation, electron in a magnetic field, perturbation theory, WKB approximation, identical particles. Applications include alpha decay, electrons in a periodic lattice, hydrogen spectrum, helium atom, neutron-proton scattering, and quark model of baryons.

Prerequisite(s): MA 2122 and PH 2344.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 4444 Quantum Optics

4 Credits Beginning with a review of classical optics and quantum mechanics, this course covers foundations of spectroscopy, including atomic transition rates, selection rules and spectral line shapes. The course explores the quantum nature of light. Topics include photon statistics, coherent states, squeezed light, resonant light-atom interactions, atoms in cavities and laser cooling.

Prerequisite(s): PH 3474.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 4554 Solid State Physics

4 Credits The course covers basic concepts in condensed matter physics and preparation for the advanced quantum theory of solid state.

Prerequisite(s): PH 2344.
Weekly Lecture Hours: 4 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 4601 Special Topics in Physics
Variable credit special topics courses in physics.

Prerequisite(s): PH 2344 and Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 4602 Special Topics in Physics**

Variable credit special topics courses in physics.

Prerequisite(s): PH 2344 and Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 4603 Special Topics in Physics**

Variable credit special topics courses in physics.

Prerequisite(s): PH 2344 and Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 4604 Special Topics in Physics**

Variable credit special topics courses in physics.

Prerequisite(s): PH 2344 and Physics adviser approval. (Course may be repeated for additional credit.)
Weekly Lecture Hours: 0 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 4902 Introduction to Senior Project in Physics**

A qualified senior physics student or group of students work with a faculty member (and possibly graduate students) on an advanced problem in physics. In this introductory phase the student(s) and adviser select a suitable theoretical or experimental problem in the subject area and use various resources to solve it.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 4 | Weekly Recitation Hours: 0

**PH 4904 Senior Project in Physics**

In the project’s concluding phase, senior physics students or group of students work with a faculty member (and possibly graduate students) to solve an advanced problem in interdisciplinary physics. The conclusion of the project is a written report and an oral presentation made to the supervising faculty.

Weekly Lecture Hours: 0 | Weekly Lab Hours: 8 | Weekly Recitation Hours: 0
PH 4912 Senior Seminar in Physics

2 Credits Senior physics students, in consultation with the instructor, study and prepare presentations on several current research topics in the general area of interdisciplinary physics. Students’ performance is rated on the mastery of the material chosen and also on the quality of the presentation made to the instructor and the seminar members.

Weekly Lecture Hours: 2 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 5343 Physical Basis of Nanotechnology

3 Credits This course focuses on the underlying physical basis of nanotechnology. Introduction to nanotechnology, examples of nanoscale systems. Systematics in miniaturization from the mm to the nm scale. Limits to miniaturization. Quantum concepts and elementary Schrödinger theory. Quantum effects in the behavior of chemical matter. Examples of self-assembled nanosystems from nature and from contemporary industrial products.

Prerequisite(s): PH 2033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 5443 Physical Techniques and Applications of Nanotechnology

Prerequisite(s): PH 2033.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 5473 Modern Optics

Prerequisite(s): MA 2122 and PH 3234 or equivalents.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 5481 Modern Optics Lab
The modern optics laboratory includes experimental investigations into laser modes, velocity of light by time-of-flight, Fourier optics, holography, Fourier transform spectroscopy, crystal optics and nonlinear optics.

**Pre/Co-requisite:** PH 5473 or equivalent.
Weekly Lecture Hours: 0 | Weekly Lab Hours: 3 | Weekly Recitation Hours: 0

**PH 5493 Physics of Nanoelectronics**

3 Credits This course covers limits to the ongoing miniaturization (Moore’s Law) of the successful silicon-device technology imposed by physical limitations of energy dissipation, quantum tunneling and discrete quantum electron states. Quantum physical concepts and elementary Schrodinger theory. Conductance quantum and magnetic flux quantum. Alternative physical concepts appropriate for devices of size scales of 1 to 10 nanometers, emphasizing role of power dissipation. Tunnel diode, resonant tunnel diode, electron wave transistor; spin valve, tunnel valve, magnetic disk and random access memory; single electron transistor, molecular crossbar latch, quantum cellular automata including molecular and magnetic realizations. Josephson junction and “rapid single flux quantum” computation. Photo- and x-ray lithographic patterning, electron beam patterning, scanning probe microscopes for observation and for fabrication; cantilever array as dense memory, use of carbon nanotubes and of DNA and related biological elements as building blocks and in selfassembly strategies.

**Prerequisite(s):** PH 2033.
**Also listed under:** EL 5533.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 5553 Physics of Quantum Computing**

3 Credits This course explores limits to the performance of binary computers, traveling salesman and factorization problems, security of encryption. The concept of the quantum computer based on linear superposition of basis states. The information content of the qubit. Algorithmic improvements enabled in the hypothetical quantum computer. Isolated two-level quantum systems, the principle of linear superposition as well established. Coherence as a limit on quantum computer realization. Introduction of concepts underlying the present approaches to realizing qubits (singly and in interaction) based on physical systems. The systems in present consideration are based on light photons in fiber optic systems; electron charges in double well potentials, analogous to the hydrogen molecular ion; nuclear spins manipulated via the electron-nuclear spin interaction, and systems of ions such as Be and Cd which are trapped in linear arrays using methods of ultra-high vacuum, radiofrequency trapping and laser-based cooling and manipulation of atomic states. Summary and comparison of the several approaches.

**Prerequisite(s):** PH 2033.
**Also listed under:** EL 5553.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 5663 Physics of Alternative Energy**

3 Credits The course examines non-petroleum sources of energy including photovoltaic cells, photocatalytic generators of hydrogen from water, and nuclear fusion reactors. The advanced physics of these emerging technical areas are introduced in this course. Semiconductor junctions, optical absorption in semiconductors, photovoltaic effect. Energy conversion efficiency of the silicon solar cell. Single crystal, polycrystal, and thin film types of solar cells. Excitons in bulk and in confined geometries. Excitons in energy transport within an absorbing structure. Methods of making photocatalytic surfaces and structures for water splitting. Conditions for nuclear fusion. Plasmas and plasma compression. The toroidal chamber with magnetic coils as it appears in recent designs. Nuclear fusion by laser compression (inertial fusion). Small scale exploratory approaches to fusion based on
liquid compression and electric field ionization of deuterium gas.

Prerequisite(s): PH 2033.
Also listed under: EL 5663.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6153 Theoretical Mechanics I

3 Credits Principles of particle and rigid body dynamics. Lagrange's equations. Small vibrations of coupled systems, normal modes of oscillation.

Prerequisite(s): Graduate standing, or for undergraduates, PH 2104 or equivalent and physics graduate adviser's approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6163 Theoretical Mechanics II

3 Credits Hamiltonian mechanics. Transformation theories of mechanics including the Poisson Bracket and Hamilton-Jacobi formulations. Lagrangian formulation of mechanics of continuous media.

Prerequisite(s): PH 6153.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6243 Electromagnetic Theory I

Prerequisite(s): Graduate Standing, or for undergraduates, PH 3234 or equivalent and physics graduate adviser’s approval.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6253 Electromagnetic Theory II

Prerequisite(s): PH 6243.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6403 Physical Concepts of Polymer Nanocomposites

3 Credits This course presents fundamental aspects of polymer nanocomposites and updates on recent advancements and modern applications. Topics include nanostructured materials; assembly at interfaces; interactions on surfaces; properties of polymer
PH 6513 Introduction to Solid-State Physics I

3 Credits Phenomena and theory of physics of crystalline solids. Topics from thermal, magnetic, electrical and optical properties of metals, insulators and semiconductors.

Prerequisite(s): PH 2344 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6523 Introduction to Solid-State Physics II

3 Credits Phenomena and theory of physics of crystalline solids. Topics from thermal, magnetic, electrical and optical properties of metals, insulators and semiconductors.

Prerequisite(s): PH 6513.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6553 Advanced Quantum Computing

3 Credits Advanced topics in quantum computation are explored.

Prerequisite(s): PH 5553.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6633 Statistical Mechanics I

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PH 6643 Statistical Mechanics II

Prerequisite(s): PH 6633.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
**PH 6673 Quantum Mechanics I**

*3 Credits* Quantum mechanics with applications to atomic systems. The use of Schrodinger’s equations. Angular momentum and spin. Semi-classical theory of field-matter interaction.

*Prerequisite(s):* MA 2122 and PH 3234 or equivalents.

*Also listed under: EL 6553.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 6683 Quantum Mechanics II**

*3 Credits* Quantum mechanics with applications to atomic systems. The use of Schrodinger’s equations. Angular momentum and spin. Semi-classical theory of field-matter interaction.

*Prerequisite(s):* PH 6673.

*Also listed under: EL 6563.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 8013 Selected Topics in Advanced Physics**

*3 Credits* Current or advanced topics of particular interest to graduate students are examined. Subject matter is determined each year by students and faculty. The course may be given in more than one section. Consult department office for current offerings.

*Note: this course is not offered every semester.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 8023 Selected Topics in Advanced Physics**

*3 Credits* Current or advanced topics of particular interest to graduate students are examined. Subject matter is determined each year by students and faculty. The course may be given in more than one section. Consult department office for current offerings.

*Note: this course is not offered every semester.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PH 9531 Graduate Seminar in Physics I**

*1.5 Credits* Students presenting current topics in Physics in a seminar setting to other students and supervising faculty. Topics chosen by the student with guidance from faculty.
PH 9541 Graduate Seminar in Physics II

1.5 Credits Students presenting current topics in Physics in a seminar setting to other students and supervising faculty. Topics chosen by the student with guidance from faculty.

Weekly Lecture Hours: 1.5 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Psychology

PS 997X MS Thesis

This course is an independent research project that demonstrates scientific competence and that is performed under the guidance of advisers. The course may be repeated for total up to 6 credits.

Prerequisite(s): consent of adviser.

PS 2323/W Environmental Psychology

3 Credits This course looks at how people interact with their environments: how settings affect behavior; how people change environments to fit their needs; and how people can become an active part of the environmental-design process. The course discusses how people use space and the way environmental design meets (or fails to meet) human needs. These concerns are valid for very-small-scale design problems (as in human-factors engineering); mid-size spaces (architecture and interior design); large scale spaces (communities, urban areas).

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PS 2613 Psychology of the Internet

3 Credits This class investigates aspects of human behavior in terms of the Internet. The Internet is a technological phenomenon that allows people separated by huge distances to interact with each other in relatively seamless fashion. Does the Internet allow people to connect in ways never possible before? Or are these new connections variations of previous human interactions, only
on a computer screen. For all of its positive attributes, the Internet has a negative side: People become increasingly dependent on interacting only through the Internet. Is this dysfunctional? What characterizes addictive behavior? Can addictive behavior be attributed to a physical action as opposed to a biological substance?

*Prerequisite(s):* EW 1023 or EN 1233W or EN 1203H.
*Note:* Satisfies a humanities and social sciences elective.

**PS 2643 Creativity and Innovation**

*3 Credits* This course explores the nature of the creative act. What does it take to be creative? What are some of the cognitive and personality variables that aid and hinder creativity? What are the characteristics of great innovators? Is innovation purely individual? Or are innovators a product of their time? The course also surveys literature on teaching creativity and innovation.

*Prerequisite(s):* EW 1023 or EN 1233W or EN 1203H.
*Note:* Satisfies a humanities and social sciences elective.

**PS 2663 Intelligence: Real and Artificial**

*3 Credits* This course explores the nature of intelligence, both human and computer, and covers historical debates centered on intelligence testing. Can computers be programmed to think? If they can, what would a “thinking” computer look like? The course covers issues such as the Turing test and human-computer interaction.

*Prerequisite(s):* EW 1023 or EN 1233W or EN 1203H.
*Note:* Satisfies a humanities and social sciences elective.

**PS 2723 Human Factors in Engineering Design**

*3 Credits* The purpose of this course is to familiarize students with basic concepts, research findings and theories related to the way in which human characteristics, capabilities and limitations, including physiology and psychology, affect system design and performance. Students will develop a basic understanding of methods for studying and assessing human behavior and for analyzing human performance. It will introduce aspects of system, interface, organizational design and physical setting as they influence operators and performance.

*Prerequisite(s):* EW 1023 or EN 1233W or EN 1203H.
*Note:* Satisfies a humanities and social sciences elective.

**PS 3603 Psychology of Internet Security**

*3 Credits* This course looks at the relationship between psychology and online security. How do computer hackers access secure computers strictly by asking people for their password? What are the key features of current security messages and how can they be made more explicit so the average computer user can understand them? What social-psychology principles are required for a secure network? And what perceptual issues help secure a computer network?
Prerequisite(s): One level 2 STS cluster course.
Note: Satisfies a humanities and social sciences elective.

PS 3693 Humor and Modern Media

3 Credits Humor is considered one of the most pleasurable positive emotions. The questions asked will include: What makes something funny? Why do people find someone falling down funny in one culture and tragic in another? What are the cross-cultural implications of humor and how have they been affected by a global worldview? How has the Internet changed our view of humor, now that technologies like YouTube make it possible for anyone to be a director or cinematographer with a worldwide audience? Topics will include psychoanalysis; superiority; reversal theories of humor; the psychology and psychobiology of humor; and humor, laughter and mental health.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

PS 3723 Psychology of Sustainability

3 Credits This course addresses the psychological bases of environmental problems, investigates theories of behavior change as they relate to environmental issues and introduces practical strategies to foster behavior change. Topics include the ways in which the fit (or lack of it) of design to human behavior can affect environmentally relevant behaviors, such as energy use and recycling. Course issues include designing green buildings and creating sustainable communities.

Prerequisite(s): One level 2 PS course.
Note: Satisfies a humanities and social sciences elective.

PS 3743 Psychology of Transportation

3 Credits The human element is the central focus of all transit systems. How users respond to a transportation system ultimately determines its success or failure. Psychological and behavioral issues range from the small scale (ergonomics of signal and platform design; design that causes slips, trips and falls), to the psychological and psycho-physiological (such as commuter stress), through large-scale implementation (mode choice, social impacts of highways or transit lines).

Prerequisite(s): One level 2 PS course.
Note: Satisfies a humanities and social sciences elective.

PS 3753 Psychology of Living in Extreme Environments

3 Credits This course considers issues, research and theory in relation to creating human habitats in extreme space, undersea and polar regions. The course reviews firsthand experiences and formal studies of life in these settings, and extrapolates from work in other, less extreme human settings. Psychological issues include privacy, territoriality, isolation and crowding, light and views of nature, as well as personality and organizational issues. Students complete a research paper and engage in a team-design project.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.
**PS 3813 Social Psychology of Virtual Worlds**

*3 Credits* This course explores human relations in the virtual world. Do real-world interactions maintain themselves in an online community, or do the rules of social interaction change significantly in a virtual environment? When people perceive themselves as being anonymous, do they feel the same responsibility for their own behavior, or do they interact with others differently as they would in the real world? This course examines the psychology of online, virtual relationships with a view to compare and contrast them with real-world relationships.

*Prerequisite(s): One level 2 PS course.*

*Note: Satisfies a humanities and social sciences elective.*

---

**PS 3833 Special Topics in Psychology**

*3 Credits* This course discusses new or experimental topics in psychology offered by current or visiting faculty.

*Prerequisite(s): One level 2 PS course.*

*Note: Satisfies a humanities and social sciences elective.*

---

**PS 4443 Guided Readings in Psychology**

*3 Credits* The course focuses on selected problems in psychology. Faculty members supervise students in pre-arranged individual or group studies/projects involving guided reading or research. This course is for mature students who undertake specialized independent study under tutorial guidance.

*Prerequisite(s): Consent of instructor.*

*Note: Satisfies a humanities and social sciences elective.*

---

**PS 9053 Psychology: Applied**

*3 Credits* This course demonstrates how various problems, particularly in work, can be solved through the judicious use of psychological principles. Phenomena addressed include human-machine interaction and other engineering-behavior interactions, smoking, study habits, memory, creative thinking, group interaction, raising children, influencing people, self control and specific problems brought up in class by students. Students learn to employ behavioral analysis to understand various problems. Students select a problem, perform behavioral analysis and modify it as a class project.

*Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0*

---

**PS 9063 Human Cognition and Information Processing**

*3 Credits* This course covers human cognitive capabilities, including natural language and information processing. Topics: Memory, internal representation of knowledge, concept information, symbol manipulation, language acquisition, reasoning and problem solving. Artificial intelligence approaches to natural language learning and acquisition of cognitive skills.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9073 Human-Computer Interaction**

*3 Credits* This course introduces students to human behavioral issues in designing and using interfaces for information systems. Basic issues of behavioral research and evaluation methods are discussed. Sensory systems and memory and learning theory relevant to human factors systems are reviewed and related to specific interface issues, such as interaction devices, dialogue design and reference material. The focus is on understanding the issues involved in creating systems amenable to human use.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9083 Research Methods**

*3 Credits* This course examines theory and methods of sensory-functions measurement in human and animal subjects. Topics: Examination of the concept of the threshold and problems of its measurement. Investigation of learning—motor and verbal, simple and complex—including problem solving and creative thinking. Students perform a series of experiments with human and animal subjects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9093 Experimental Psychology**

*3 Credits* The course explores experimental and descriptive methods, including quasi-experimental design and large-scale survey techniques used by social, environmental and developmental psychologists to assess human behaviors in laboratory and natural settings. The course focuses on laboratory and observational methods used to assess environmental effects, attitude measurement, social impact assessment and theory and psychometric bases of normal personality development and assessment.

*Prerequisite(s): PS 9083 or consent of adviser.*

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9103 Theories of Learning**

*3 Credits* The course looks at programmed learning, behavior therapy, attitude function and social interaction. All students are required to perform one experiment on learning under instructor guidance. Available to undergraduate majors in social science.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9113 Psychology of Language and Communication**

*3 Credits* The course deals with methodological problems in analysis of language, verbal behavior in animals, anatomical and physiological aspects of speech apparatus, operant and respondent conditioning of verbal behavior, semantics, statistical
approaches and mathematical models, contextual factors and pathology of speech. All students are required to perform one experiment under guidance of instructor.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9123 Sensation and Perception**

3 Credits This course reviews different sensory systems: vision, audition, taste, smell, touch, temperature sensitivity, vestibular and kinesthetic senses and their relations to nonsensory controlling stimuli such as states of the organism, learning and social psychological variables. Topics: Techniques for obtaining psychophysical data on each sensory system and relations of these techniques to theories of discrimination. Available to undergraduate majors in social science.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9133 Physiological Psychology**

3 Credits The course covers physiological and anatomical bases of behavior. Topics: Memory, motivation, emotion, sleep reward mechanisms, psychosurgery and higher cortical functions.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9153 Behavioral and Societal Aspects of Transportation**

3 Credits This course explores behavioral analyses of transportation decision-making and travel characteristics. Topics: User needs in design of transportation systems: crowding, social isolation, crime, comfort and convenience. Social impact of transport systems on communities.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9203 Seminar in Psychology**

3 Credits This seminar discusses major areas of psychology required of all MS candidates. Topics: History and systems, sensation and perception, learning, developmental and abnormal.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**PS 9253 Social Impact Assessment**

3 Credits This seminar discusses major areas of psychology required of all MS candidates. Topics: History and systems, sensation and perception, learning, developmental and abnormal.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0
PS 9263 Environmental Psychology

*3 Credits* The course covers theory and methods of measuring sensory functions in human and animal subjects. Topics: Examination of the concept of the threshold and problems of its measurement. Investigation of learning—motor and verbal, simple and complex— including problem solving and creative thinking. Students perform a series of experiments with human and animal subjects.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

PS 9283 Advanced Topics in Environmental Psychology

*3 Credits* This course varies from year to year depending on the needs and interests of students and instructors. Potential subjects include social impact of transportation systems; stress and the environment; aversive environmental factors; laboratory assessment of environmental effects on animal learning; effects of pollution; human factors of software design; assessing the built environment, including the office; and applied behavioral analysis. The course may be repeated for total of up to nine credits.

Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Registrar

Registrar

RE 9990 PhD Examination

*0 Credits* PhD students register for this course in any semester in which a PhD qualifying exam is taken. This course carries no credit, and the student incurs no fees. It provides a place in the student’s official transcript to record when the qualifying exam was taken and the result.
STS 241x Special Topic in STS

Variable. Credits Variable credit special topic in Science and Technology Studies. Topic to be decided by instructor.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 340x Independent Study in STS

Variable. Credits Variable credit independent study in Science and Technology Studies. Topic to be decided by instructor.

Prerequisite(s): One Level 2 Humanities and Social Sciences Elective from the STS Cluster and instructor's permission.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 341x Special Topic in STS

Variable. Credits Variable credit special topic in Science and Technology Studies. Topic to be decided by instructor.

Prerequisite(s): One Level 2 STS Cluster Humanities and Social Sciences Elective and instructor's permission.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2003/W Science, Technology, and Society

3 Credits This course introduces students to important issues, historical and contemporary, related to science and technology from a variety of social, political, and philosophical viewpoints. We shall use a multidisciplinary approach to understand the interaction between science, technology and society and to discover the conditions that foster technological innovation. The scientific and technological way of thinking will become clear through historical examples, helping us to consider important issues of science and technology policy, such as how science and technology can be used to benefit society and how one can foster innovation in a society or an organization.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2113/W History and Philosophy of Internet Technology

3 Credits This course investigates implementations of internet technologies. We will examine the founding premises of the internet, uncovering the assumptions about culture, policy objectives, and ideals of practitioners, both before and after the worldwide web. The course investigates typical claims about the internet, such as its capability to inculcate democracy, and also the development of the attendant hardware and software infrastructure.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.
STS 2123/W Digital Humanities

3 Credits What happens to works of the humanities when they are distributed electronically and created on computers? What values from the analog humanities should be preserved in the digital world? This course examines traditional works of literature available in electronic formats as well as digital-only creations.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

STS 2133W Perspectives on Science and Technology Reporting

3 Credits The effective communication of scientific and technological ideas is essential in a society and culture as influenced by science and technology as our own. At some point in their careers, scientists and engineers will be called on to convey technical concepts and ideas to each other, to government agencies, to private corporations, and to the public at large. These job functions are required for various reasons, including: (1) to support the marketing and public relations efforts of a company, (2) to provide the latest state-of-the-art information for the benefit of peers working in a specific industry and (3) to demonstrate to shareholders and customers the achievements attained in the corporation’s research and development laboratories. Moreover, non-experts in technical fields may be called on to participate in these and similar discussions. This course addresses these issues by having students study, research and write articles about three technologies where R&D activity is proceeding at a rapid pace: telecommunications, plastics materials development and processing, and energy.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2143 Public Policy Issues in Telecommunications

3 Credits This course addresses the myriad public policy issues arising from the phenomenal growth of the telecommunications industry, especially in light of convergence and the fierce competition that it has spawned over the past decade. Among the most pressing issues of the day are networking neutrality, Internet censorship, privacy, standardization, the enforcement powers of the FCC, workplace monitoring, and spectrum allocation. In addition, the course will introduce the student to the basic concepts of the technology, provide a historical perspective of the industry (with an emphasis on the cataclysmic chain of events set off by the Modified Final Judgment in 1983 that led to the break-up of AT&T), and explore trends. As a major requirement, students will be asked to give oral and written presentations on a major international or domestic public policy issue currently besetting this industry.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2153 Addressing Public Policy Issues in the Sciences, Engineering and Medicine

3 Credits This course explores public-policy issues on critical and often controversial questions in science (e.g., cap-and-trade, global warming, LEDs as lighting sources, biofuels, spectrum allocation), medicine (e.g., embryonic stemcell research, national health care, genetic therapy, workplace risks of nanotechnology), and technology (e.g., off-shore drilling, biotechnology, clean coal, nuclear energy, “smart” power). Students will select areas in which to specialize and will be required to submit a white
paper on one of these major issues. The report will be based on library research and face-to-face interviews with experts in the field. As students draft sections of their white papers, they will submit them for class discussion and they will meet periodically with the instructor to review their progress.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2163/W Science Fiction

3 Credits A distinct genre of literature emerges during the twentieth century that imagines new possibilities and challenges for human society in light of scientific and technological change. This course reviews important authors of this field, considering whether science fiction can be an agent of social change and how well it can critique or imagine the interaction between science, technology, and society.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2223 Medical Ethics

3 Credits This course is concerned with the many ethical issues that arise in the field of medicine, issues such as: patient autonomy, informed consent, experimentation on live subjects, confidentiality, truth telling, conflict of interest and the treatment of relatives. We will also study moral issues pertaining to new medical techniques such as online medicine and prenatal genetic screening. These issues will be approached via an understanding of important historical, legal and philosophical foundations of medical ethics. We will study ideas from the Hippocratic Oath and Islamic, Jewish and Christian traditions up to the codes of today's ethics review boards. Important legal issues explore the right to healthcare, the obligation of parents to seek proper medical care for their children and euthanasia. Some of the important ethical-philosophical notions studied will be: the law of double effect, the obligation of beneficence and non-malevolence, utilitarianism, and Kantian ethics. While this course is open to all majors, it's specific aim is to prepare the future medical practitioner to understand and deal with the various moral challenges of the profession.

Prerequisite(s): Prerequisites: EN 1013 or EW 1013, and HUSS 1023 or EW 1023.

STS 2233W Magic, Medicine, and Science

3 Credits This course looks at the metaphysical and epistemological origins of three systems of thought - the organic, the magical, and the mechanical - and considers the extent to which modern science can be seen as arising from their synthesis. Topics include Presocratics, Plato, Aristotle, Plotinus, the Hermetic Corpus, Ficino's naturalistic magic, Pico's supernatural magic, Paracelsus and the ontic theory of disease, Copernicus, Galileo, Kepler, Descartes, the Cambridge Platonists, and Newton.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2253/W Biology and Society
This course explores the relationship between the biological sciences and society from Enlightenment France to the Human Genome Project and biotechnology in the United States. Ever since the Enlightenment, the study of nature has played an ever-increasing role in shaping social issues. For example, we shall exam the roles played by gender, social class, and natural theology in eighteenth-century classifications of plants and animals. We shall also investigate how biologists and anthropologists drew upon rather ambiguous notions of nature to classify humans into races. We shall then trace Darwin's theory of evolution and how it shaped, and was shaped by, socio-economic, political, and religious views. We shall discuss the depressing history of eugenics in Britain and the U.S. We shall conclude by provocatively asking if there is a link between eugenics and the Human Genome Project. We shall also see how economics, politics, and religion have shaped biotechnology and human-embryonic-stemcell research. The student is invited to think about the way in which debates concerning "nature versus nurture" have been framed historically, in order to understand current controversies over that distinction.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.

Note: Satisfies a Humanities and Social Sciences Elective.

STS 2263W The Rhetoric of Science

This course is an introduction to the history, theory, practice, and implications of rhetoric - the art and craft of persuasion. Specifically, this class focuses on the ways that scientists use various methods of persuasion as they construct scientific knowledge. By first examining the nature of science and rhetoric, we will then examine texts written by scientists and use rhetorical theory to analyze those texts. We will look at the professional scientific research articles and other genres of scientific writing. Finally, we'll investigate the way that rhetoric plays a role in the everyday life of scientists. Throughout the class, we will wrestle with questions, such as: How is science rhetorical?; What can rhetorical analysis tell us about the ways that scientists use persuasion?; and, How might rhetorical analysis limit our understanding of science?

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.

Note: Satisfies a Humanities and Social Sciences Elective.

STS 2273W Science and Sexuality

This course explores and analyzes the constructions of sexuality in the biological, social, and medical sciences, focusing on issues in evolutionary biology, endocrinology, neuroscience, psychiatry, comparative anatomy, and genetics. Throughout the semester, we shall compare the various meanings given to sexuality across disciplinary frameworks, paying attention to the increasingly unstable relationships between the categories of fiction and science, reproduction and sexuality, nature and culture, male and female, animal and human, and hetero- and homosexuality. We shall also assess how expert scientific discourses influence popular understandings of sexuality and vice versa. Specifically, we will examine how they contribute to the normalization and official regulation of certain kinds of behavior, how they satisfy a desire for stories about human origins, and how they fashion terms of attraction, repulsion, affection, antagonism, dominance, and submission according to which sexuality is putatively expressed.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.

Note: Satisfies a Humanities and Social Sciences Elective.

STS 2313 It's About Time

From looking at our watch and noting the change from day to night and counting the days, months and years, time seems so mundane that we take it for granted and usually think little more about it. But what is time and why do we measure it so obsessively and with such precision? This course will concern itself with all aspects of time, from the evolution of calendars
(including our own) to precision timepieces and our own internal clocks. And finally, the nature of time itself and its relationship to space and other aspects of our universe will be discussed. This course will draw on knowledge from history, anthropology, psychology, technology, astronomy and physics to gain an understanding of this very basic “dimension”.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2323 Dinosaurs: Resurrecting an Extinct Species

3 Credits Large fossil bones have fascinated people since ancient times, and after 1842 some of these fossils were described as belonging to the taxon Dinosauria. Since then, new discoveries and scientific techniques have led to a series of changes in both the views of scientists and the public as to what dinosaurs were, what groups they were related to, and how they behaved and interacted with their environments. This course will look at the views of fossils in ancient Greece and Rome, and also in some modern tribal societies. Most emphasis will be on the changing views of paleontology, geology, biology and evolution from the Enlightenment period to the present. All major dinosaur groups will be discussed, as well as their physiology, relationships to other animals, behavior and ecology, as scientific ideas evolve and new discoveries are made. Finally, how scientists reconstruct dinosaurs through images, sculpture and mountings for the public and popular culture’s fascination with dinosaurs will be discussed.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2333 Evolution

3 Credits This course discusses the development of the theory of evolution based on the amassed evidence from the geological and biological sciences over the past two hundred years. Darwin’s idea that natural selection was the driving force behind evolution will be considered in detail. Early rival theories to Darwin’s ideas will also be discussed as part of the process leading to the modern theory. The integration into the theory of genetics and molecular biology have led to a much deeper understanding of how organisms are related. The role of chance factors will also be considered. Application of evolution theory to problems in economic biology and modern medicine and epidemiology will also be discussed. Finally, current controversies regarding Intelligent Design will be addressed and put into a historical context.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 2343 Imaging the Past

3 Credits Images of prehistoric landscapes, creatures and human cultures abound in our society. This course will discuss the scientific bases for reconstructing prehistoric environments and cultures. Information derived from field work in geology, paleontology and archaeology - stratigraphy, fossils, mineralogy and human artifacts - is used to piece together an ancient landscape and its life. The use of modern chemical and isotopic techniques to establish paleoclimates and water conditions will be described. Information from taxonomy, biomechanics, and comparative anatomy, physiology and genetics can “flesh out” the appearance and lifestyles of extinct groups. Equally important, is how this scientific information is transformed into images, sculpture, dioramas and digital information that can physically visualize past life, culture and environments. The history of such depictions and the scientific techniques that have produced them will be discussed in some detail.
Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.  
Note: Satisfies a Humanities and Social Sciences Elective.

**STS 3003/W Seminar in Science and Technology Studies**

3 Credits  This course considers the current state of the field of Science and Technology Studies. Students are exposed to the range and methods of STS as well as their own place within the field. The course is designed specifically to bring students with different academic backgrounds into contact with each other in a classroom setting.

Prerequisite(s): One Level 2 STS Cluster Humanities and Social Sciences Elective.  
Note: Satisfies a Humanities and Social Sciences Elective.

**STS 3013 Directed Study in STS**

3 Credits  Directed study under supervision of faculty adviser in Humanities and Social Sciences. Students are exposed to foundational research techniques under the guidance of a faculty adviser. Library research, written and oral reports required.

Prerequisite(s): STS 2003/W and permission of STS faculty adviser.  
Note: Does not satisfy a Humanities and Social Sciences Elective.

**STS 3163 Science and Technology in the Literary Sphere**

3 Credits  How does literature seek to accommodate new ideas from science? When do new technologies find their way into the public sphere? What happens when scientists and engineers translate their findings into novels or other narratives? This course reads literature as evidence of the diffusion of technological and scientific ideas. When literary forms are used to promote, challenge, or even misrepresent scientific or technical developments, we gain insight into the interaction between scientists, engineers, and society at large. This course may be organized around different themes, but it always explores how scientific and technological ideas fare in the republic of letters.

Prerequisite(s): One Level 2 STS Cluster Humanities and Social Sciences Elective.  
Note: Satisfies a Humanities and Social Sciences Elective.

**STS 3173 Hypermedia in Context**

3 Credits  This course investigates precursors to new media, revealing the possibilities and limitations of today’s incarnations. Searching analog media for examples of supposedly new technologies like associative thinking, multimedia, and participatory design, we will examine the social and economic structures that allow for such tools to arise and to determine what exactly is new in new media. Further, we consider how we can use the concept of antecedent to critique present manifestations of media and how we can incorporate ideas from the past into the present while avoiding homologies.

Prerequisite(s): One Level 2 STS Cluster Humanities and Social Sciences Elective.  
Note: Satisfies a Humanities and Social Sciences Elective.
STS 3243W Humans, Machines, and Aesthetics

3 Credits This seminar proffers a glimpse into the historically contingent relationships between machines and humans from the Enlightenment to the Industrial Revolution. We shall underscore the ways in which those interactions helped define aesthetics, particularly in music. In a very real sense this course traces the history of creativity over the past three centuries.

Prerequisite(s): One Level 2 STS Cluster Humanities and Social Sciences Elective.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 3263/W Science and Difference

3 Credits This course critically examines the various frameworks through which science operates to construct difference in living populations. It analyzes the logistics of classification as they pertain to modern empirical science and situates classificatory practices in their historical and cultural contexts. Particular attention is paid to the interplay between scientific research and historical episodes of cultural anxiety concerning the nature and significance of human differences based on race, gender, ethnicity and sexuality.

Prerequisite(s): One Level 2 STS Cluster HuSS Elective, and EW 1023 or equivalent

Note: Satisfies a HuSS Elective

STS 3263W Science and Difference

3 Credits This course considers the historical development of the science of difference – in particular, race and gender – from the scientific revolution to the present. We seek to understand historical episodes of cultural anxiety over biological variation by examining the construction of difference in living populations. Topics include historical theories of human variation, scientific racism and its rejection, the history of ethnicity and sexuality, colonialism and eugenics.

Prerequisite(s): One Level 2 STS Cluster Humanities and Social Sciences Elective.
Note: Satisfies a Humanities and Social Sciences Elective.

STS 4003 Study Abroad

3 Credits For STS majors only. Takes the form of either an internship or a semester studying abroad. Internship option: Supervised semester-long project carried out in a community or industry setting. Evaluated on the basis of written and oral reports presented to faculty and external project Co-sponsors. Students must maintain a course-load equivalent of 12 credits (including the 3 for STS 4003) during this semester. Study-Abroad option: Semester-long course of study at a foreign institution. Students must maintain a course-load equivalent of 12 credits (including the 3 for STS 4003) during this semester.

Prerequisite(s): Junior/Senior status and permission of STS faculty adviser.
Note: Does not satisfy a Humanities and Social Sciences Elective.

STS 4014 Capstone Project
4 Credits This is a research project under the supervision of an STS faculty adviser. Library research, written and oral reports are required.

Prerequisite(s): Senior status, permission of STS faculty adviser, STS 2003/W, STS 3003/W, and STS 3013.
Note: Does not satisfy a Humanities and Social Sciences Elective.

STS 4401 Independent Study in Science and Technology Studies

1 Credits

Society, Environment and Globalization

SEG 291x Special Topics in Society, Environment and Globalization

Variable Credits This course looks at selected topics and issues concerning human society, the environment or globalization at the 2000 level.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

SEG 391x Special Topics in Society, Environment and Globalization

Variable Credits This course covers selected topics and issues concerning human society, the environment or globalization at the 3000 level.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

SEG 491x Special Topics in Society, Environment and Globalization

3 Credits This course looks at selected topics and issues concerning human society, the environment or globalization at the 4000 level.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.
SEG 2183/W Beyond Oil: Fueling Tomorrow's Vehicles

3 Credits This course explores the alternatives to oil that vehicle manufacturers are pursuing in their desire to wean away from oil and its mercurial price swings. Students will be required to choose two of these alternative approaches and prepare white papers on each, covering the technology, advantages, limitations or drawbacks, cost saving, environmental impact and likelihood of success in the market place. The focus will be on biofuels, hybrids, the fuel cell, natural gas, hydrogen, the electric car.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

SEG 2193/W Writing About Nature and the Environment

3 Credits In this course, students explore today’s major environmental and ecological issues and write a number of pieces that discuss causes and possible solutions. Each article is based on a literature search and on interviews with professionals. Class critiques of articles are an integral part of the learning process. Topics include global warming, renewable energy, health and the environment, environmental law and biodiversity. Authors of the best pieces are encouraged to submit them for publication.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.

SEG 3213 Sustainable Systems and the Natural History of Whaling

3 Credits The Cetaceans (whales, dolphins and porpoises), including some of the largest animals ever known to have lived, have evolved many unusual structures, physiologies and social organizations. This course discusses Cetacean biology, including their ecological relationships and their social and migratory behaviors. The course covers the history of the whaling industry, ships, catching whales, processing them and shipping the products. The uses and markets for the products also are discussed. Topics include the global aspects of whale harvesting, the depletion of whale stocks, and attempts by governments and concerned groups to control and stop the hunting. Discussions include international frustrations over whaling-control bans—whales were part of the ocean “commons,” accessible to all nations. The course also looks at the seal-fur trade industry and fishing threats to the dolphin/porpoise population.

Prerequisite(s): One level 2 PS course.
Note: Satisfies a humanities and social sciences elective.

Transportation

Transportation
TR 900x Readings in Transportation

Variable Credits This is an individually guided effort involving research into a topic of interest, usually growing from a course the student has taken. Readings courses should not duplicate material available in a regularly scheduled course, but should involve additional research on a topic or topics of interest to the student that is related to a course or courses. A formal written report is required. The student must have a faculty adviser who agrees to work with them and an agreed-upon topic before registering. The student may register for 1 to 3 credits for a readings effort, in proportion to the effort and as approved by the supervising instructor.

Prerequisite(s): Permission of supervising instructor.

TR 997X MS Thesis in Transportation

3 Each Credits Students electing to take a 6-credit MS Thesis commit to a significant individually guided research effort, resulting in a formally defended thesis report, bound in accordance with Institute requirements.

Prerequisite(s): MS degree status and permission of thesis adviser.

TR 999X PhD Dissertation in Transportation Planning and Engineering

Variable (24 Total) Credits The dissertation is an original investigation embodying the results of comprehensive research in a specific area of transportation worthy of publication in a recognized, formally refereed transportation journal. Students must defend formally their dissertations and submit a bound written document. Students must complete a minimum of 24 credits of dissertation registration before defending. Once the dissertation is started, the student must maintain a minimum of 3 credits of registration during each semester (not including summer) until the dissertation is complete. During the last semester of registration, the student may be permitted to register for .5 credit with the permission of the Graduate Office and dissertation adviser.

Prerequisite(s): Passing grade for RE 9990 PhD Qualifying Exam, graduate standing, and dissertation advisor approval

TR 6013 Fundamental Concepts in Transportation

3 Credits This course provides the contextual foundations to study urban transportation systems, using performance criteria reflecting the perspectives of system providers/owners, users and communities. The connection between transportation supply, travel demand, service volume and level of service is explored and quantified for various travel modes. The impacts of transportation system performance on travel behavior, communities and the environment is discussed. The role of technology and institutions is examined with case examples.

Prerequisite(s): Graduate status or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 6023 Analytic Methods in Transportation
This course introduces transportation students to a variety of analytic techniques as they are commonly applied to transportation issues. The course covers basic statistics and statistical analyses and their application to transportation studies, including traffic characteristics studies and survey instruments. Mathematical techniques for analyzing transportation queues are covered. Statistical tests for significance of improvement impacts are illustrated. Regression analysis applied to developing transportation models is covered. An introduction into traffic simulation is also given.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 6113 Forecasting Urban Travel Demand**

This course is to study methods and models used in estimating and forecasting person travel in urban areas. The objective is to understand the fundamental relationships between land use, transportation level of service and travel demand, and to apply methods and state-of-the-practice models for predicting person travel on the transportation system.

Pre/Co-requisite: TR 6013 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 6213 Transportation Economics and Finance**

This course provides the basic principles of engineering economic analysis and their application to transportation projects. Half of the course covers the concepts of present worth, capital recovery, sinking funds and annual cost applied to economic comparisons and evaluations of alternatives. The second half of the course delves into financing transportation and how government policy on transportation affects the economy and environs at the local, state and federal levels. Historical perspectives on the financing of highway systems, public transportation systems and transportation agencies are presented. Other subjects include privatization, innovative financing methods, business plans.

Prerequisite(s): TR 6013 or permission of adviser
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 6223 Intelligent Transportation Systems and Their Applications**

This course introduces the concepts and applications of Intelligent Transportation Systems (ITS) and its growing role in the management of transportation systems. The course stresses the role of ITS as national policy, as specified in major transportation funding legislation – ISTEA, TEA21 and SAFETY-LU. A systems engineering approach to overall development of ITS technologies is stressed. Major components of ITS are discussed, and examples of their application treated. Coordination and integration of ITS components are treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

**TR 6313 Traffic Control and Signalization I**
Traffic controls are imposed to provide for safe, efficient and orderly movement of people and goods on our nation’s street and highway systems. Traffic control is examined in the urban context in which both vehicles and pedestrians be accommodated. Techniques for quantifying traffic stream behavior are described. Federal, state and local standards for designing and implementing control devices are presented. Selection of control measures, design and timing of traffic signals at individual intersections and in arterial networks is treated in detail. Use and application of current computer tools – HCS++ and Synchro – are illustrated.

Prerequisite(s): TR 6013 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 6323 Traffic Control and Signalization II

In furtherance of the material covered in TR 6313, emphasis is on the arterial as a facility and on systems concepts such as traffic calming, access management and roundabouts as a design element. Also covered are network problems induced by traffic congestion and remedies such as critical intersection control, network metering, oversaturated control policies and real time sensing, and traffic impacts from growth and development, including assessment and mitigation. The course employs the use of modern tools, including VISSIM, Synchro/SIMTraffic and HCS++, and two projects must be completed by students working in teams. This course should be taken in the student’s last or penultimate semester.

Prerequisite(s): TR 6313 or equivalent and TR 6113 or equivalent.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7033 Transportation Safety and Security

Technology, legislation and market forces have contributed to improved transportation safety for decades. But one must consider which metrics are most relevant for which modes, the role of demographics and traffic levels and other factors when analyzing and predicting safety trends. The course pays attention to a systems view, to metrics by mode and to both standard field and statistical analyses. Consistent with current priorities, the course addresses security as well as safety issues.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7123 Transportation Planning and Congestion Management

This course provides a contextual understanding of urban transportation planning and its component activities. It helps students understand the enabling environment needed to sustain the planning process; to understand the causes of transportation congestion and its impacts on transportation users and communities; to set forth a vision for congestion management; and to develop and evaluate strategies and policies that achieve the vision.

Pre/Co-requisite: TR 6013 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7133 Urban Public Transportation Systems
This course provides a thorough understanding of policy, planning, operational and technical issues that affect urban public transportation. It includes the historical development of cities and the rise of urban transport. Also covered are the characteristics of various urban transportation modes (their specific operating and infrastructure characteristics), as well as key elements that are critical to service provision, such as service planning, scheduling, fare collection, communication and signaling, station design and customer service. The course offers a broad perspective on regional planning, capital programming and policy matters. Special focus will be on emerging technologies and their practical applications.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7213 Transportation Management

This course presents an overview of the transportation management profession. Levels of management and unique objectives of management in the transportation sector are presented and discussed. Management structures for private and public transportation organizations are analyzed. Management practices are treated from the perspective of organizations, optimization of the use of public resources, legislative and legal contexts and operations.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7223 Management of Transit Maintenance and Operations

This course provides a comprehensive understanding of modern public transportation systems, emphasizing their technology and operational practices. Planning and management aspects are also covered. Such operational management issues as maintenance practices, scheduling, procurement and labor relations are broadly outlined and discussed. Planning and capital programming issues are also treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7243 Intelligent Transportation Systems: Deployments and Technologies

Transportation infrastructure deploys a wide range of modern technology to provide service to travelers, the general public and private entities. This technology enables other systems to function effectively and serve societal needs. This course focuses on data communications and applications in intelligent transportation systems: communications alternatives and analyses, emerging technologies, geographic information systems (GIS) and global positioning systems (GPS).

Prerequisite(s): TR 6223 or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7323 Design of Parking and Terminal Facilities

This course covers design techniques and approaches to a variety of pedestrian and vehicular needs in conjunction with access to land functions. Parking serves as the primary access interface to many land facilities, from shopping centers and sports
facilities, to medium- and high-density residential developments. The planning and design of parking facilities, and the planning of access and egress from these facilities, is critical to the economic success of a development. Terminals are inter-modal interface facilities involving the transfer of people and/or goods from one mode of transportation to another. This course covers essential elements of terminal planning and design, including transit stations and terminals, major goods terminals at ports and railheads and others. The design of pedestrian space and ways within terminal structures is also treated.

Prerequisite(s): TR 6013 or permission of adviser.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 7343 Urban Freeways and Intercity Highways

3 Credits This course focuses on the design, analysis, control and management of urban freeways and intercity highways of all classes. The course covers geometric design standards and principals, the application of highway capacity and level of service analysis methodologies (including HCS++), marking and signing, speed control and modern freeway management systems and approaches.

Prerequisite(s): TR 6013, TR 6313, or equivalents, or permission of instructor.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 8013 Selected Topics in Transportation I

3 Credits These courses are given as needed to present material on current topical subjects that are not expected to be given on a regular basis. The topic(s) for each offering are indicated and are listed on the student’s transcript. These courses may be taken more than once if the listed topics are different.

Prerequisite(s): TR 6013 Fundamental Concepts in Transportation and as approved for the topic(s); to be specified for each offering.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

TR 8023 Selected Topics in Transportation II

3 Credits These courses are given as needed to present material on current topical subjects that are not expected to be given on a regular basis. The topic(s) for each offering are indicated and are listed on the student’s transcript. These courses may be taken more than once if the listed topics are different.

Prerequisite(s): TR 6013 Fundamental Concepts in Transportation and as approved for the topic(s); to be specified for each offering.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 0

Urban Studies

Urban Studies
URB 2023/W Design of Cities

3 Credits This course helps students examine cities from different perspectives, and to understand the design principles that create effective city spaces and how the city is a dynamic force, always changing through the impact of individuals and organizations. The class focuses on the role of historical, physical and social context in making sense of cities and how city problems can be identified, presented to others and addressed in various ways (through psychological and sociological studies, literature, art, etc.). Students complete a team-based project that involves the study of an innovative development project within the city and how it relates to its physical and social context.

Prerequisite(s): EW 1013, EW 1023 or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

URB 2033 Humans in the Urban Environment

3 Credits In an increasingly urban dominated world, the environmental and ecological underpinnings of the human species help us understand why and how permanent settlements and cities evolve. The course covers basic environmental and ecological relationships, including geological, climatological, biomes, population growth models and carrying capacity. Receiving special emphasis are those ecosystems most important to humans throughout prehistory and history. The development of agriculture, increased human resource productivity and the resulting increase in population density is discussed as an underlying basis for developing and maintaining urban population areas. Also included is a discussion of changes in human social organization and psychology necessary for urban living.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

URB 2043 Methods for Studying Urban Environments

3 Credits This course provides students with a foundation for understanding and using social science research methods to study urban environments. In this course, students will gain an understanding of quantitative and qualitative approaches to social science research. They will be introduced to a range of data collection methods that are used to study urban environments and also strategies for data analysis. The course will involve a group research project with a real world client, as well as lectures, discussions, a group presentation and paper, exams, readings and several assignments.

Prerequisite(s): EW 1013 and EW 1023 or equivalent

URB 2053 Introduction to Urban Policy

3 Credits The purpose of this course is to introduce students to the process and some of the major substantive issues in urban policy and politics in the United States, with some transnational contrasts. These include some of the basic issues of any political system: how cities function as part of a global urban network; the structure of decisionmaking, the allocation of resources and delivery of services.
Prerequisite(s): EW 1023 The Advanced College Essay

URB 2223 Natural Environment of New York City

3 Credits New York is one of the world’s great cities and, like others, rests on a foundation of the natural environment. The geology and geographic history of the greater New York area is discussed—from plate tectonic origins through the recent (and ongoing) Ice Age, including the formation of river systems and the port. Also considered in detail is the evolution of ecological relationships, including human, throughout this time. Other topics include the changing climate through past epochs as well as today and their impact on the modern city. Also covered are current environmental challenges, such as water supply and quality, air quality, waste disposal and global effects, including atmospheric and ocean warming.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Satisfies a humanities and social sciences elective.

URB 2233 Natural Environmental Catastrophes and Cities

3 Credits Cities are extremely complex physical and human systems that can be severely disrupted by acute human-caused events such as war. However, the natural world can also have a severe impact on cities over brief intervals. This course concerns itself with four well-known phenomena that can and have influenced the development, sustainability and even the survival of cities. Meteorological catastrophes, such as hurricanes, cyclones and typhoons, are discussed in detail. Also covered are less violent but equally destructive flooding by river and ocean; earthquake damage and its relationship to population density and the permanence of towns and cities throughout history; and volcanic eruptions, which, though rare, have disrupted cities and determined their initial locations. Finally, biological catastrophes, both macro and micro, such as pestilence and infestations, are discussed.

Prerequisite(s): EW 1023 or EN 1233W or EN 1203H.
Note: Notes: Satisfies a humanities and social sciences elective.

URB 3013 Directed Study in SUE

3 Credits Directed study supervised by a faculty adviser in Humanities and Social Sciences. Students, guided by a faculty adviser, are exposed to foundational research techniques. Library research, written and oral reports are required.

Prerequisite(s): URB 2033 or URB 2023/W, and permission of SUE faculty adviser.
Note: Does not satisfy a humanities and social sciences elective.

URB 3033 Evidence-Based Design

3 Credits Designers—at the product, building, neighborhood or urban level—necessarily base their work on the perceived needs and desires of users and clients. Historically, these understandings have come from past practice, close interactions with clients or designer intuition. In recent years, however, design researchers have accumulated enough information to provide an empirical base upon which to base many design decisions. This class reviews the evidence for design, particularly as it relates to well-studied settings, such as health care, corrections and neighborhood design.
URB 3113 Case Studies in Sustainability (Ancient Egypt and Mesoamerica)

3 Credits Today, many societies are addressing whether their lifestyles and standard of living are environmentally sustainable or not. This course examines a few societies, some now much changed from what they once were, that also faced such questions. Ancient Egypt, arguably Earth’s oldest civilization, developed along the Nile River. The agricultural surpluses supported a large population and freed many from farming to be artisans, clerks, lawyers, soldiers and rulers. This course describes the rise and flourishing of ancient Egypt and its social relationships, culture and customs. It also covers the rise of Egyptian cities, warfare and empire building. In contrast, the Mayans of Central America produced a complex civilization that had declined even before Europeans arrived. Victims of resource depletion, the Maya no longer live in their great cities. The history and relationships of these two cultures to their environments illustrate the fate of civilizations based on resource availability and sustainability.

Prerequisite(s): URB 2033 or URB 2023/W.
Note: Satisfies a humanities and social sciences elective.

URB 3233 Planning for Healthy Cities

3 Credits This course is designed to introduce students to the role of the built environment in promoting community health, focusing on the neighborhood scale. Although urban planning and public health are closely related in their history and their goals, these fields are typically taught and practiced independently. The course will examine health issues that can be influenced by urban planning, and will explore the role of transportation, land use planning, urban design, community development, and environmental policy, to promote public health.

Prerequisite(s): Prerequisites: HUSS 1023W or EW 1023 or equivalent

URB 3313 History and Design of Urban Parks

3 Credits Today, urban parks have become an integral feature of most modern cities. This course describes the origins of urban parks—from private urban-palace gardens to the large, open “natural” public parks so critical to urban life today. The design of these parks, from formal Italian and French gardens to British Landscape gardens, is discussed. The course also examines the changing view of nature in Europe and America, from the Renaissance to the present, and how park design was influenced by this evolving view. The design was strongly influenced by the changing view of nature’s psychological, spiritual and even supposedly medical benefits, and by the need for “parks for the people” as an expression of the new democratic spirit in a changing world. This course also includes two of New York City’s most famous parks, Central Park in Manhattan and Prospect Park in Brooklyn.

Prerequisite(s): URB 2033 or URB 2023/W.
Note: Satisfies a humanities and social sciences elective.

URB 3353 Urban Impact Assessment
3 Credits Impact assessment is an international, interdisciplinary field of knowledge and practice for anticipating the conditions of change and managing their consequences in order to enhance everyone's quality of life. Two phrases can describe its essence: “comprehensive and integrated” and “proactive and creative.” Urban impact assessment applies that knowledge at the urban scale, ranging from local to global. Coupled with the recent innovation of “sustainability assessment,” it aims to advance the proposition of urban sustainability. This course also explores the dimensions and proportions of that prospect by applying urban impact assessment methodology to a variety of cases at hand.

Prerequisite(s): URB 2033 or URB 2023/W.
Note: Satisfies a humanities and social sciences elective.

**URB 3833 Special Topics in Sustainable Urban Environments**

3 Credits Special topics in Sustainable Urban Environments at the 3000 level, to be decided by instructor.

Prerequisite(s): URB 2033 or URB 2023/W.
Note: Satisfies a humanities and social sciences elective.

**URB 4014 Study Abroad**

4 Credits For SUE majors only. The study-abroad is a semester-long course at a foreign institution. Students must maintain a course-load equivalent of 12 credits during this semester.

Prerequisite(s): Prerequisites: Junior/Senior status and permission of SUE faculty adviser.
Note: Does not satisfy a humanities and social sciences elective.

**URB 4024 Capstone Project**

4 Credits The capstone is a research project that presents SUE students with an opportunity to translate previous coursework into an applied research effort. This is a real-world based course in which students work in teams to identify, research, and propose solutions to a multidisciplinary urban issue, supervised by an SUE faculty member in weekly class discussions. The field research should be supported by library research and culminates in a written and oral report.

Prerequisite(s): Senior Status, permission of SUE faculty advisor. Note: Does not satisfy a humanities and social sciences elective.

**URB 4033 Internship**

3 Credits Students may undertake an internship for academic credit with an appropriate private, public, or non-profit agency or firm. The internship is an opportunity to extend learning outside of the classroom into a real world setting, and to explore career options tied to the major. Students complete 140 hours at the internship site and attend occasional class meetings. The course involves completing a learning contract, regular reflections, assignments, and a final presentation.

Prerequisite(s): Prerequisite: IDM/SUE/STS majors only. Permission of instructor required.
URB 4443 Guided Readings in Sustainable Urban Environments

3 Credits This course, supervised by faculty, covers selected problems in sustainable urban environments and involves guided reading and/or research on topics to be arranged. The course is for mature students seeking specialized independent study under tutorial guidance.

Prerequisite(s): URB 2033 or URB 2023/W.
Note: Satisfies a humanities and social sciences elective.

Other Courses

PH 1013H Honors Mechanics

3 Credits This course is the first of a three-semester lecture sequence in general physics for science and engineering students. Motion of particles and systems of particles. One-dimensional motion. Vectors and two-dimensional motions. Forces and acceleration. Conservation of energy and momentum. Rotations. The free and driven harmonic oscillator. Gravitation.

Prerequisite(s): MA 1024 or MA 1054 or MA 1324 and Enrollment in Honors Program. Corequisite(s): MA 1124 or MA 1154 or MA 1424 and EG 1 Examination Hour.
Weekly Lecture Hours: 3 | Weekly Lab Hours: 0 | Weekly Recitation Hours: 1

Undergraduate Academic Requirements and Policies

Program Areas

Polytechnic Institute of New York University focuses uniquely on the world of technology and its interactions with society. To fulfill its mission, NYU-Poly offers degree programs in five general academic areas:

- Computer Science and Engineering
- Engineering
- Sciences and Mathematics
- Science and Technology Studies
- Technology Management

Computer Science and Engineering

Computer science and engineering is an important and expanding field as today’s society advances further into the Information Age. Computer science and engineering includes designing systems (computer hardware and software) and developing principles
for applying computers to new uses. The field requires high levels of theory and practice and often involves developing or integrating complex software.

Computer science and engineering is a major element in modern information technology, allowing information to be used to analyze and solve problems in diverse fields, including telemedicine, health care, finance, entertainment, manufacturing, telecommunications, transportation and biomedicine. Because of the breadth of its potential applications, computer science and engineering at NYU-Poly has a multidisciplinary focus.

The curriculum integrates basic science, computer science, mathematics, humanities and social sciences. Students take electives in technical and non-technical subjects, a mix that allows for flexibility and breadth in their studies at NYU-Poly.

The current faculty works in state-of-the-art fields such as high-speed imaging, classification, software virus protection, high-speed graphics, text and data mining, fault-tolerant computing, database-management systems, software engineering, data compression, data security, parallel and distributed computation, scheduling theory, computer vision and Internet and Web technologies. This faculty experience, combined with a strong curriculum that integrates theory and practice, positions NYU-Poly graduates well for the 21st century.

**Engineering**

Engineering is the creation of devices and implements that can control or manipulate nature to produce a desired effect, applying science to build the infrastructure and tools society needs to improve the quality of life and the environment.

The modern engineer must have a firm background in the sciences and mathematics. Science reveals fundamental knowledge about the natural world. Mathematics is the language used most often to describe that world and is used by engineers to manipulate it. Additionally, a background in the liberal arts provides a fundamental understanding of society, its structures, needs and desires. No one can hope to improve society without such understanding. Engineers also must deeply appreciate the role they play in society, particularly in terms of their professional ethics and responsibilities. Finally, engineers must have excellent written and oral communication skills to work effectively with other engineers, professionals, decision-makers and the public.

NYU-Poly’s engineering programs build on a firm foundation of mathematics and science to develop the analytic and conceptual skills required of a practicing professional. Laboratory classes introduce students to devices and systems currently used in their fields and help develop their skills in using computer-aided design packages. Undergraduate programs prepare students equally for entry into the profession and for continued education at the graduate level.

NYU-Poly, by giving students a comprehensive education in scientific and engineering principles and by developing creative skills required for engineering design and analysis, provides its graduates with the ability to continue to learn and grow in rapidly developing technological fields throughout their careers.

Current NYU-Poly faculty and alumni are advancing varied fields such as telecommunications, microwaves, imaging sciences, quantum electronics, pulsed power, smart materials, aerospace, robotics, geotechnology, biomedical engineering, financial and risk engineering, cyber security, gaming, software engineering and sensors and sensor networks. Through the NYU-Poly engineering curriculum, students are equipped to advance this tradition forward to the next generation of technological breakthroughs.

**The Sciences and Mathematics**

Science and mathematics underpin modern technology. As scientists and mathematicians discover and describe secrets of the natural world, engineers look to apply them to developing new technology. Without the physical sciences and mathematics, engineers would have no tools with which to invent the technology of tomorrow.

NYU-Poly’s undergraduate science and mathematics programs give students unique opportunities to study basic theory while interacting with design disciplines. The undergraduate program structure in these areas encourages students to select concentrations of elective courses in technology areas.
Students use modern laboratories and interact with faculty who are world-class researchers. Many upper-level classes are small, allowing students to develop one-on-one relationships with faculty and to work with them in their research areas.

The future of technology depends on the ability to develop a better and more accurate understanding of nature and its opportunities and constraints. For technology to advance, scientists must continue to unlock the secrets of the universe, and mathematicians must continue to develop the analytical and logical processes through which they can extend and apply what they investigate and discover. NYU-Poly programs prepare scientists and mathematicians for this vital role, enabling them to lead society to a better future.

Science and Technology Studies

Science and Technology Studies (STS) is an interdisciplinary field in which methods of analysis from a wide range of fields in the humanities and social sciences are used to study the relations among science, technology and society. Such methods include historical, philosophical, sociological, psychological, scientific, literary, journalistic and cultural and media-studies approaches. STS creates technology-savvy, ethical and socially responsible users, developers and critics of science and technology. It contributes a key element to developing well-rounded engineers and scientists. Such professionals are capable not only of technical expertise and its dissemination, but also of innovative and creative ways to reason and communicate with fellow citizens. STS graduates have the best of both worlds: broad training in the liberal arts coupled with expertise in science and technology. This combination makes them stand out and gives them an advantage over graduates of more narrowly focused programs.

Technology Management

NYU-Poly’s Department of Technology Management is the leading learning, research and development hub in the New York City/tri-state region, devoted explicitly to the critical arenas of innovation, information and technology management.

The department has achieved this distinguished position with a continuous stream of high-quality and relevant research, development and pace-setting learning programs. Its faculty contributes to theory and practice in an increasingly knowledge-intensive age.

The research and development conducted within the Department of Technology Management is varied, including scholarly books and articles in respected journals and timely case studies. Some of this material forms part of the content in educational programs, helping to keep programs up-to-date and distinctive. The department is also committed to integrating technology into all educational programs to enhance learning. Because all managers must understand how technology and innovation are essential for delivering value to organizations and to the market, the department offers a portfolio of educational programs dealing with the broad spectrum of innovation, information and technology management in the modern economy.

In addition to its academic programs at the undergraduate, graduate and doctoral levels, the Department of Technology Management offers short-term nondegree courses and workshops, including those tailored to the needs of specific firms and industries on contemporary topics in technology management.

Undergraduate Degree Requirements

This section details the general Institute-wide degree requirements applicable to all NYU-Poly undergraduate degrees. Academic departments may place additional requirements on individual degrees. Such additional requirements are explained in the program sections of this catalog. In no case may a department specify requirements less stringent than those indicated here.

Outcomes Assessment
NYU-Poly conducts outcomes assessments to monitor student academic achievement, effective teaching methods and continuous improvement of the Institute, as well as to facilitate compliance with accreditation standards. To obtain periodic measurements of student perceptions and intellectual growth, undergraduates must participate in surveys, focus groups, interviews or related activities. While individual input is collected, the data from these assessments are published only in aggregate form.

Undergraduate students must complete online course surveys for all courses in which they are registered each semester (except guided studies and courses in which the enrollment is fewer than six students). Graduating seniors must complete exit surveys online. Any additions to or exceptions to this requirement are disseminated to the Institute each semester by the Office of Assessment and Institutional Research. Student compliance with outcomes-assessment activities generally is a precondition for receipt of semester grade reports, transcripts and degrees.

Basic Degree Requirements and Definition of Credits

Programs for the degree Bachelor of Science require 120 to 128 credits, depending upon the major as described in the program’s section of this catalog. Undergraduate semester credits are based on the number of 55-minute periods scheduled each week during one semester. Normally, one credit signifies a minimum of either one 55-minute period of class work, or three 55-minute periods of undergraduate laboratory, over a period of 15 weeks, which includes a final exam. In a few cases, more time per credit is given. The final examination period is an integral part of the semester.

Students may attend the Institute part-time or full-time. All undergraduate degrees typically can be completed in four years of full-time study. To earn the degree Bachelor of Science from NYU-Poly, students must satisfy Institute residency requirements. Nearly all undergraduate courses are given during the day. A selection of evening undergraduate courses is available, but it is not possible to complete any undergraduate degree by taking courses entirely in the evening.

To earn a bachelor’s degree, students must have a cumulative GPA of 2.0 or better in all courses at NYU-Poly; further details can be found in the section on academic standing and probation. Some programs have additional grade requirements in specified courses or groups of courses. Most undergraduate engineering curricula require students to participate in team projects, including participation in team design-project exercises. Students must participate in outcomes assessment, as described below.

Selection of a Major

Undergraduate students admitted to NYU-Poly are encouraged to declare their major upon admission, although incoming first-year students may enter initially as “undeclared”. First-year students wishing to consider several program options are encouraged to use their first semester to explore major fields in consultation with departmental advisers. While NYU-Poly’s first year curriculum is nearly uniform for all engineering majors and very similar for other majors, students who choose to delay selecting their major until the end of the freshman year must select courses in consultation with their academic advisers.

Students are free to change their major at any time, given that their scholastic standing is acceptable to the program into which they wish to transfer. However, changes in major may involve some loss of credit. Students entering NYU-Poly with an undeclared major must declare any currently offered undergraduate major by the end of their first year.

Selection of a Minor

A minor is an approved concentration of academic study within a single discipline. In specified programs, undergraduate students may select a minor in a field distinct from, or related to, their major, with approval of advisers in both the major and minor fields. The name of the minor appears on students’ transcripts if the approved 14-15 credits in the minor field have been completed with at least a 2.0 GPA. With the consent of a student’s major department, some courses used to satisfy the minor requirements also may satisfy the required or electives course requirements in the student’s major program. The names and associated requirements for minors are listed in the sections of this catalog devoted to related major programs.

NYU Cross-School Minors
NYU-Poly students have the opportunity to minor at other schools of NYU. A NYU-Poly student may minor in a discipline not typically offered at NYU-Poly. If a similar minor in name and content at NYU-Poly exists, students must receive permission from the NYU-Poly academic department offering the minor in order to enroll in such a minor at NYU. With the consent of a student's major department, some courses used to satisfy the minor requirements may also satisfy the required or electives course requirements in the student's major program. Minors will be noted on the student's transcript as "Minor in XXX at NYU". Students will follow all policies, procedures and academic time lines of the respective NYU school.

Students must consult their major academic adviser to determine the applicability of courses towards their NYU-Poly degree. Students will need additional credits than the minimum required to satisfy their degree requirements if courses taken for a minor at NYU do not meet the requirements specified by a student's program of study. When declaring a minor, students will indicate the courses they plan on completing for the minor. For each course taken, students must obtain approval from their NYU-Poly academic adviser as well as the corresponding academic department at NYU-Poly by completing the "Permission to Take Courses at NYU (Washington Square Campus)" form available on the Registrar's website.

Below is a list of cross-school minors offered at the Washington Square Campus. Note that declaration of a minor does not constitute guaranteed enrollment in all classes; registration timelines and deadline need to be strictly followed:

- College of Arts And Science (CAS) - All cross-school minors offered are available to NYU-Poly students.
- Steinhardt School of Culture, Education and Human Development - Music
- Stern School of Business (in collaboration with CAS and NYU-Poly) - Business Studies
- Tisch School of the Arts - Game Design

**Course Placement Evaluation**

NYU-Poly gives select incoming first-year students placement and diagnostic examinations in writing and mathematics. Transfer students are required to take the mathematics diagnostic exam.

NYU-Poly’s placement and diagnostic evaluations are intended to ensure that each student receives the most pertinent instruction in basic areas needed to complete their degree program successfully. Placement evaluations may supersede the results of Advanced Placement examinations and/or acceptable transfer credits from another institution of higher education as determined by the designated adviser and the department offering the course.

**Mathematics Diagnostic Examination**

The Mathematics Diagnostic Examination is an extensive test to profile students’ knowledge and skills in basic and advanced mathematics. The mathematics department uses the scores on various components of this examination to place students in pertinent mathematics courses. Entering first-year students (except those with AP credit) are placed in MA 902/MA 912, MA 914, MA 1024, MA 1054, or MA 1324.

**Writing Placement Examination**

Both employers and accrediting organizations increasingly emphasize the need for students to have well-developed written and oral communications skills. No engineer or scientist can be an effective professional without the ability to communicate, not only with those in his or her own field, but also with professionals in other technical and non-technical fields, with private and public decision makers and with the general public. As such, NYU-Poly’s degree programs involve frequent writing and speaking assignments across all areas of the curriculum. It is essential that all students have necessary background skills before enrolling in upper-division courses related to their professional studies.
To ensure that students are placed into the proper writing course, some admitted undergraduate students will be required to take the Institute’s writing-placement exam. This timed essay exam is used to evaluate each student’s writing ability and to ensure that he or she is placed into the appropriate writing course. On the basis of this test, students are placed into the standard first-year courses (EW 1013 Writing the Essay or they may first be required to take one or more semesters of an introductory course in English (EN 1080W Introduction to College Writing for ESL Students) before proceeding to the first-year courses.

If an incoming undergraduate student is not required to take the English placement exam, the student is placed in EW 1013. Then, all students are given a first-day writing assignment during the first class period of all the writing courses. Individual instructors read and assess these assignments, and if a student seems to have been placed into an inappropriate class, the instructor consults with the Writing Program director and assistant director, and the student may be moved into a more appropriate course. Note: EN 1080W does not carry credits toward a degree. However, it does contribute to the full-time credit load during the semester in which it is taken.

Students who successfully complete EW 1013 continue to EW 1023 The Advanced College Essay. Students who successfully complete EN 1080W move into EW 1013. Occasionally, however, a student who has completed EN 1080W may have the choice to enroll in EW 1013 if the instructor believes the student has achieved sufficient fluency in English. Students placed in EN 1080W may take this course during their first regular semester. Typical schedules can be rearranged to accommodate this approach. Institute guidelines do not permit undergraduate students placed into EN 1080W to progress to more advanced humanities courses until they receive a passing grade in that course.

**Writing and Speaking Across the Curriculum**

NYU-Poly has adopted a Writing and Speaking Across the Curriculum program to ensure that graduates develop adequate communications skills. The program ensures that significant writing and speaking assignments are included in designated courses throughout students’ undergraduate program and that course grades are influenced by the quality of presentation in addition to mastery of content.

To support this program, the Polytechnic Tutoring Center (PTC) houses the Writing Center for students; the Center is staffed by instructors, professional writers and qualified tutors. Students are encouraged to make an appointment to improve their writing and speaking skills.

Core courses such as EW 1013, EW 1023, EG 1003, select humanities and social sciences electives, and all senior design projects are writing- and speaking-intensive courses. Each disciplinary curriculum also identifies other courses that fit into this category.

In addition to the required 6 credits of first-year writing, NYU-Poly students also are required to complete 18 credits within the humanities and social sciences. One of these courses must be Writing-Intensive (designed with a “W”), and one must be at the 3000 or 4000 level. For more information about this requirement, and to see a list of courses, please refer to the Department of Technology, Culture and Society overview.

**Core Requirements for Engineering Majors**

All engineering majors must follow the core curriculum outlined in this section. Non-engineering majors take particular parts of this core, as described in the programs section of this catalog. Students entering the Institute as undeclared majors also are required to closely follow this core curriculum and may select any NYU-Poly major at the end of one year of study. Changes in major may involve some loss of credit.

The core curriculum ensures that every engineering student is exposed to a relevant mix of general preparatory courses in the liberal arts, mathematics and the basic sciences. It is also intended to ensure a breadth of knowledge of fundamental engineering principles and an appreciation and understanding of all engineering disciplines.

The components of the core curriculum are as follows:
(1) Introduction to Major

Each department has a 2 credit introductory course designed to increase students' knowledge of their field of study and familiarizes them with the different disciplines within their major. An additional benefit of these courses is that students begin to interact with faculty in their major department, encouraging engagement and fostering community building through intellectual and scholarly activities. In their first year of study, students must take their department's version of this course (usually listed as XXX1002 or XXX1012) when it is offered. Students who have completed more than 32 credits are not permitted to enroll in any Introduction to Major course except MG 1002.

(2) Engineering and Technology Forum

All incoming first-year students, including transfer students with fewer than 6 credits, must take EG 1001 Engineering and Technology Forum (1 credit). In this course, the notions of invention, innovation and entrepreneurship (i²e) are brought to the forefront of students' educational experience in an effort to introduce undergraduates to elements of a research-intensive institution and to encourage intellectual and scholarly interaction with their peers and faculty. This course includes presentations and discussions on emerging and exciting topics by leading engineers, scientists, inventors and entrepreneurs. The readings of the course are case studies on innovations, inventions and entrepreneurship as well as relevant contemporary and emerging environment-, economic-, global-, energy- and health related topics. The course encourages collaboration and creativity coupled with peer-to-peer learning and exposes students to an array of collegiate academic skills such as the elements of a research-intensive institute, information-technology resources and ethics in science and engineering.

(3) Engineering Design

The centerpiece of the core curriculum for engineering majors is engineering design. EG 1003 Introduction to Engineering and Design ensures that all engineering majors have a common base of knowledge of key engineering principles and a thorough appreciation of the range of applications of these principles across engineering disciplines. This first-year engineering course provides an early introduction and immersion in engineering as both an intellectual discipline and a professional pursuit.

The Accreditation Commission for Engineering and Technology (ABET) defines six fundamental areas of engineering: mechanics, electric and electronic circuits, materials science, thermodynamics, transport phenomena and computer science. The engineering design core is constructed to expose all engineering majors to many of these fundamental areas.

All engineering students are required to take the following two courses:

1. EG 1003 Introduction to Engineering and Design (3 credits)
2. Capstone Design Project*

*Actual course code depends on department.

EG 1003 is focused on hands-on experiential learning and the process of engineering design as the unique professional function of the engineer. Each major defines its own capstone senior-design projects, but every engineering student must complete one.

Transfer students may replace EG 1003 with an advanced technical course if they enroll in the Institute at a sophomore or higher level, subject to adviser approval.

(4) Mathematics Core

Every engineering student must complete a minimum of 16 credits of study in mathematics.

The following courses are required of all engineering students:

- MA 1024 Calculus I or MA 1054 Calculus I with Precalculus (4 credits)
- MA 1124 Calculus II or MA 1154 Calculus II with Precalculus (4 credits)
- MA 2012 Elements of Linear Algebra I (2 credits)
- MA 2132 Ordinary Differential Equations (2 credits)

Each engineering discipline specifies 4 to 8 additional credits of mathematics from the list below.

Consult the program’s section of this catalog for information on specific requirements and preferred sequencing for each discipline.

- MA 2112 Multivariable Calculus A (2 credits)
- MA 2122 Multivariable Calculus B (2 credits)
- MA 2212 Data Analysis I (2 credits)
- MA 2222 Data Analysis II (2 credits)
- MA 2312 Discrete Mathematics I (2 credits)
- MA 2322 Discrete Mathematics II (2 credits)
- MA 3012 Introduction to Probability I (2 credits)
- MA 3112 Complex Variables I (2 credits)

(5) Basic Science Core

The basic science core consists of 14 credits of study in the critical areas of chemistry and physics. The following courses are required of all engineering majors:

- CM 1004 General Chemistry for Engineers (4 credits)
- PH 1013 Mechanics (3 credits)
- PH 2021 Introductory Physics Laboratory I (0.5 credit)
- PH 2023 Electricity, Magnetism and Fluids (3 credits)
- PH 2031 Introductory Physics Laboratory II (0.5 credit)
- PH 2033 Waves, Optics and Thermodynamics (3 credits)

NOTE: Some departments may require additional credits of science. See the programs section of this catalog for details.

(6) Engineering Problem Solving and Programming

This course, CS 1133, is an introductory course in engineering problem solving and computer programming for all undergraduate engineering and science students without experience in programming in any language. CS 1133 enables students to develop problem-solving skills used by engineers and scientists. The course covers the fundamentals of computer programming and its underlying principles, using the MATLAB programming language. Concepts and methods introduced in the course are illustrated by examples drawn from various engineering and technology disciplines. Useful numerical techniques and their applications to real-world problems in science and engineering are discussed.

(7) Writing

Engineering students will take two writing classes in their first year at NYU-Poly. These classes serve as a primer for students to develop their ability to engage with a text, to look at it critically and to respond to the text in kind. In order to do so a student needs to be able to formulate their ideas in a clear and concise manner. This sequence of courses emphasizes the necessity of strong writing skills not just for student’s undergraduate education, preparing them for writing across the curriculum, but for success after their undergraduate degree as well.

(8) Humanities and Social Sciences
Every engineering student must take a minimum of 18 credits in the humanities and social sciences. These courses have two objectives: to develop students’ communication skills and to expose them to a balanced study of the liberal arts. Both areas are critically important and contribute to the general literacy of engineering undergraduates as they deal with the world and societal issues that set the context for the practice of their professions.

**Engineering Competencies**

All NYU-Poly undergraduate engineering programs are accredited by the Accreditation Board for Engineering and Technology (ABET). ABET identifies the following core competencies that every engineering program should address: (a) an ability to apply knowledge of mathematics, science and engineering; (b) an ability to design and conduct experiments and to analyze and interpret data; (c) an ability to design a system, component or process to meet desired needs; (d) an ability to function on multidisciplinary teams; (e) an ability to identify, formulate and solve engineering problems; (f) an understanding of professional and ethical responsibility; (g) an ability to communicate effectively; (h) the broad education necessary to understand the impact of engineering solutions in a global and societal context; (i) a recognition of the need for, and an ability to engage in, lifelong learning; (j) a knowledge of contemporary issues; (k) an ability to use the techniques, skills and modern engineering tools necessary for engineering practice.

Some course descriptions list the ABET competencies that they address.

**Modifications to Curricula**

**Course Substitutions**

Curricula sometimes change to keep students abreast of the latest knowledge and methods within the subject area, especially in the science, engineering and technology areas taught at NYU-Poly. Students are informed of these changes by their major department.

The Institute responds to changes in curricula and course content and addresses special situations. To that end, it occasionally needs to substitute a course for one that is specified in the curriculum to meet degree requirements. A student documents such substitutions on an Adjustment of Degree Requirements form available from the Office of the Registrar’s website. Each substitution must be documented on the form and approved by the student’s major adviser and by the Office of Undergraduate Academics. If a graduation checklist has been issued at the time of the substitution, the change should be formally entered on the checklist and approved by the major adviser and the Office of Undergraduate Academics.

**Interruption of Study**

NYU-Poly graduates must fulfill degree requirements using courses that currently meet the current standards in the field. Accordingly, students have up to eight years to complete the degree requirements in effect when they first enrolled in a NYU-Poly undergraduate degree program. This time limit is irrespective of any leave of absence granted during the eight-year period. As courses continuously evolve, the Institute may replace some courses in the original degree requirements with comparable ones with updated contents. Should the Institute establish a new set of degree requirements for new students, continuing students may choose to satisfy the new requirements. In such cases, the Institute decides which portion of the new requirements may be satisfied by the courses students have completed and also rules on modification, if any, of the original eight year time limit.

If a student has exceeded or is about to exceed the eight-year limit and has not yet finished their degree requirements, they need to appeal for an extension in order to finish the remaining courses.

To appeal, the student must consult with their academic adviser and fill out the “Extension of Time Limit to Complete Degree” form. All courses remaining in order to complete their degree must be listed and the time frame in which they will be completed.
The form should then be signed by their academic adviser and the Dean of Undergraduate Academics before it is submitted to the Registrar’s Office.

BS/MS Program

Undergraduates with strong academic records in certain programs may apply for admission to the BS/MS Program, which leads to the simultaneous award of a bachelor’s and a master’s degree, sometimes in less time than it takes to complete both separately. This program allows students to make accelerated progress towards completing the two degrees through combinations of AP credits, summer course work and additional credits completed each semester; additionally, undergraduate students enrolled in this program are allowed to take graduate level courses before they complete the bachelor's degree. Qualified students are considered for admission into the program toward the end of their sophomore year or the beginning of the junior year at the latest; however, students interested in pursuing this option should talk to their undergraduate adviser as soon as possible. Some possible combinations of BS and MS majors that are available in this are described in the programs section of this catalog. Students accepted to this program are required to maintain a cumulative GPA of at least 3.4 for the duration of the program; some departments may have a higher GPA requirement. Additional information can be obtained from the departmental adviser, including the specific sequence of courses that will be necessary to complete two degrees simultaneously. International Students in F-1 or J-1 status must obtain permission and the necessary I-20/DS-2019 from the Office of International Students and Scholars before enrollment in the combined BS/MS program. The application for the BS/MS Program is available in the Office of Undergraduate Academics.

Dual Undergraduate Degrees

It is possible for students to earn two separate BS degrees in two disciplines. Special requirements for each degree are determined by the departmental undergraduate adviser or department head for each department, in accordance with the following rules:

- The set of courses includes all of the required courses for each degree. Some elective credits for one curriculum may be fulfilled with required credits from the other, given that sufficient senior/graduate level electives are completed to provide depth in each discipline.
- The total credits required for both degrees must exceed those required for one of the degrees by at least one full year of credit. Courses satisfying requirements in both degrees may be counted only once for this purpose. Total credits required for the two degrees are, therefore, computed using the following formula:

  \[ \text{Total Credits} = \frac{\text{Credits (Degree 1)} + \text{Credits (Degree 2)}}{4} \]

This is a minimum, and some combinations of degrees may require additional credits. Where the two majors are closely related, such as electrical engineering and computer science, physics and electrical engineering, etc., five years of study will generally suffice to earn both degrees. Where the two degrees are less closely related, such as civil engineering and chemistry, electrical engineering and humanities, mechanical engineering and physics, etc., additional credits and more than five years will be required.

- Students working towards two degrees must (1) register in a “home” department which will be responsible for the student’s primary (first) degree, and notify the department of the intent to pursue a second degree, (2) apply for and receive admission to the second department in the same manner as a student wishing to change degrees, (3) obtain approval from both departmental faculty advisers when registering or withdrawing from a course, (4) maintain good academic standing in the Institute and in each academic department and (5) complete all courses specified in the graduation checklist provided by each department with satisfactory grades.

- Both degrees may be simultaneously earned, or the primary degree may be earned first. Graduating with the honors distinction is separately determined for each degree. To graduate in the minimum amount of time with two degrees, students should choose this option as early as possible. The courses of the two degree programs can then be interwoven to provide good academic continuity and to satisfy all prerequisites in an orderly fashion. Please note that many students, rather than earn two undergraduate degrees, prefer to earn a single bachelor’s degree followed by a master’s degree in a different, but related, discipline. Students interested in the dual degree option should check with their undergraduate advisers, as not all combinations of disciplines can be conveniently packaged in this manner.
3+2 Program with the College of Arts and Science at NYU

General Information

NYU’s College of Arts and Science offers a dual-degree program in science and engineering with the Polytechnic Institute of NYU. This program affords highly qualified and motivated students who are technically oriented the opportunity to pursue both a liberal arts program with a major in science and a traditional engineering program. The program is ideal for the student interested in science and engineering who is also eager for a liberal arts experience before entering an undergraduate engineering environment. Upon completion of this five-year program, students receive the Bachelor of Science degree from the College of Arts and Science at New York University and the Bachelor of Science degree from the Polytechnic Institute of NYU.

The available dual-degree combinations are as follows:

- BS in biology/BS in chemical and biomolecular engineering
- BS in chemistry/BS in chemical and biomolecular engineering
- BS in computer science/ BS in computer engineering
- BS in computer science/ BS in electrical engineering
- BS in mathematics/ BS in civil engineering
- BS in mathematics/ BS in computer engineering
- BS in mathematics/ BS in electrical engineering
- BS in mathematics/ BS in mechanical engineering
- BS in physics/BS in civil engineering
- BS in physics/BS in computer engineering
- BS in physics/BS in electrical engineering
- BS in physics/BS in mechanical engineering

Detailed programs of study for each of the curricula are available from the NYU’s College Advising Center, Silver Center, 100 Washington Square East, Room 905.

Students who are interested in this program apply directly to NYU’s College of Arts and Science, indicating their interest in this program on their application. Application materials for this dual-degree program may be requested from New York University, Office of Undergraduate Admissions, 665 Broadway, 11th Floor, New York, NY 10012-2339.

The Academic Program

Students accepted into the program spend their first three years of study in the College of Arts and Science (CAS) at New York University. In the first year at the College, the different curricula call for many of the same courses. This gives students time to consult with faculty at both schools before committing themselves to a particular science/engineering major.

During Freshman Orientation, if they have not already done so, students select a major area for their study at CAS from the disciplines of biology, chemistry, computer science, mathematics, and physics. In their first year, students will have the opportunity to change this major and to reflect on their choice of engineering major. In the spring of the third year, an orientation program helps students prepare for the transition to NYU-Poly in the fourth year.

In the first three years of the program, students satisfy their core liberal arts requirements and also take some of the NYU-Poly courses required for their choice of engineering major. Students may elect to withdraw from the dual-degree program in engineering and complete only the College of Arts and Science general and major requirements at New York University. The final two years of study are undertaken at NYU-Poly’s campus.

At NYU-Poly, students complete the remaining technical courses required for their engineering major in their final two years.
Honors Distinctions

Honor Societies

Students with superior academic records and co-curricular achievements are selected in their junior and senior years to join one of the NYU-Poly chapters of a national honors society. Closely allied to the professional and technical societies, these honors societies encourage and recognize outstanding scholarship and leadership.

Current Participating Societies at NYU-Poly:

- Chi Epsilon - civil engineering
- Eta Kappa Nu - electrical engineering
- Omega Chi Epsilon - chemical engineering
- Pi Mu Epsilon - mathematics
- Pi Tau Sigma - mechanical engineering
- Sigma Xi - research
- Tau Beta Pi - engineering
- Upsilon Pi Epsilon - computing sciences

Degrees with Honors

Degrees with honors are awarded to undergraduate students of high scholastic rank upon unanimous recommendation of the faculty. Honors are based upon the following breakdown of cumulative GPAs:

- BS Cum Laude: 3.40 - 3.59
- BS Magna Cum Laude: 3.60 - 3.69
- BS Summa Cum Laude: 3.70 or greater

Transfer students are eligible to graduate with honors, including being selected as valedictorian, after they complete a minimum of 64 credits at NYU-Poly.

Undergraduate Credits

Residency

To satisfy residency requirements for the BS degree at NYU-Poly, students must complete a minimum of 64 credits at the Institute in approved courses. The student’s adviser will assist them in selecting the courses required to complete their degree. Additionally, students must complete their last 32 credits at the Institute. One-half of the courses counted toward a minor must be taken at the Institute. All transfer credits are subject to NYU-Poly’s normal transfer-credit rules and processes.

Transfer Credits from other Undergraduate Institutions

Students who have completed some undergraduate courses at other colleges or universities before beginning studies at NYU-Poly are encouraged to transfer credits to NYU-Poly programs. NYU-Poly awards transfer credit for relevant courses completed satisfactorily at other accredited institutions. Students transferring to NYU-Poly from other universities must have transcripts of
their courses examined by the Undergraduate Admissions Office and an adviser from the student’s major department to
determine the acceptability of individual substitutions and general acceptance of credits from their former institution(s). Much of
this can be accomplished during the application process if the student’s record is complete. All evaluations of transfer credits
must be completed by the end of the student’s first semester of registration at NYU-Poly. Some programs may choose to delay
approval of transfer credits until students demonstrate satisfactory progress for a semester at NYU-Poly.

Undergraduate transfer credit is not given for any course in which a grade less than C has been earned. In addition, students
completing a course at NYU-Poly for which transfer credit already has been given automatically forfeit the transfer credit for that
course.

The contents and standards of courses vary from university to university. Thus, some transfer students find after a semester’s
work at NYU-Poly that they are better prepared for advanced courses if they re-enroll in a course at NYU-Poly for which they
have been given transfer credit. Students may be required to enroll in such a NYU-Poly course after consulting with their
academic adviser. In some instances, course requirements may be waived for students who demonstrate sufficient knowledge of
specific course content through either written or oral examination given by the academic department offering such course. In
such cases, no credit is awarded, but students are allowed to submit a more advanced course to satisfy degree requirements. This
approach differs from “credit by examination,” described later in this section.

Grades of courses for which transfer credit is given are omitted in computing a student’s cumulative or current semester GPAs.

Articulation Agreements

To provide students with alternative pathways to a BS degree from NYU-Poly and to facilitate the transfer process, NYU-Poly
has developed cooperative programs with other institutions. Students completing approved programs at these institutions with
sound academic achievement are guaranteed admission to the Institute. Students interested in learning more about the cooperative
programs should contact the Office of Undergraduate Admissions.

Transfer Credits while in Residence

Undergraduates at NYU-Poly are expected to take all course work at the Institute. Exceptions are rarely made in cases where
NYU-Poly does not offer timely courses of importance to the attainment of students’ academic goals.

To obtain credit for courses taken elsewhere while enrolled at NYU-Poly, students must obtain written permission from the major
academic adviser, the department head of the course for which transfer credit is requested and the Office of Undergraduate
Academics. This must be done before registering for the course at another institution. Forms for such permission are available on
the Registrar’s website.

The following requirements apply to all courses taken outside NYU-Poly:

- The other institution must be accredited.
- Grades earned must be C or better for undergraduate courses.
- Pass/fail courses are not acceptable under any conditions.
- Only credits are granted; grades are omitted in computing cumulative or current semester GPAs.

Credits for Courses Taken at Other Schools of NYU

Students will receive letter grades to be included in their term and cumulative GPA calculations for courses taken at other schools
of New York University. Courses taken at NYU are generally classes that are not offered at NYU-Poly and may count as degree
requirements with the permission of the student’s academic adviser; foreign language courses taken at NYU will count as free
elective credits, regardless of the student’s academic program. Students must obtain permission to take courses at other schools of
NYU before enrolling in the class by completing the “Permission to take a course at NYU (Washington Square Campus)” form available on the Registrar’s website.

**Undergraduate Validation Credits**

When it is unclear whether a course taken outside NYU-Poly is suitable for transfer credit, students may qualify for transfer credit by passing a validation examination. Permission to take such an examination must be recorded in advance on the student’s transfer evaluation form at the time of application to NYU-Poly. The format of the examination is at the discretion of the department giving the course. Scheduling of the examination is by mutual agreement, but in no event more than one calendar year after the student begins study at NYU-Poly. A grade of C or better is required to validate course credits for undergraduate students. An examination may not be taken more than once. Students who register for or attend the course at NYU-Poly forfeit the right to take a validation examination.

**Advanced Placement Credits**

NYU-Poly grants students credit for approved Advanced Placement (AP) courses in high school, given acceptable performance on AP examinations. Students must request evaluation of AP credits by no later than the end of their first semester of matriculation. Credit also may be granted for college preview courses at NYU-Poly or other universities while a high-school student if these courses are relevant to the student’s degree program and acceptable grades were achieved. Grades for advanced placement or college preview courses are omitted in computing the cumulative or current semester GPAs.

**Credit by Examination**

Undergraduate students with an outstanding record or with specialized competence may establish a maximum of 16 credits toward the baccalaureate degree by passing comprehensive examinations. Each department determines the courses in which such an examination is available and the examination format. Students must obtain the approval of the department giving the course, the department of major study and the Office of Undergraduate Academics.

A grade of B+ or better is required to achieve credit by examination. Students registering for or attending a course at NYU-Poly may not subsequently take the examination for credit for the course or for a course with similar content. The examination may be taken only once.

Students pay a fee to the Office of Student Accounts before each examination and will receive the form to take the exam after making the payment. The course and credits are posted on student’s permanent record without a grade and do not count toward the minimum-residence requirement for the bachelor’s degree or toward the GPA.

**Undergraduate Thesis**

The undergraduate thesis allows students to apply knowledge gained in their major field of interest and use it to plan, conduct and report original research. The thesis may be a discourse upon a subject included in students’ courses of study, an account of an original investigation or research, or a report on a project or an original design accompanied by an explanatory statement.

The undergraduate thesis is optional except for students in the Honors Program, who are required to complete an undergraduate thesis. All undergraduate students who plan to undertake a thesis should report to the head of their major department with their choice of a thesis topic at least one year before graduation. Department heads approve requests and appoint a thesis adviser. Students should contact their thesis adviser immediately and register for the thesis during the next registration period. Thereafter, the student must register for the thesis every fall and spring semester until it is completed and accepted and the final grade is entered into the student’s permanent record. A student must take a minimum of 3 credits of thesis work for an undergraduate thesis.
Students must submit a bound BS thesis to the Office of Undergraduate Academics as outlined in the document entitled “Regulations on Format, Duplication and Publication of Reports, Theses and Dissertations,” available in the Office of Undergraduate Academics. All theses and results obtained become the property of the Institute.

Graduation

Graduation Checklist

Academic advisers of undergraduate students nearing completion of their degree requirements receive a graduation checklist that lists courses in progress and courses remaining to be completed for the degree. After the list is approved by the major academic department, the student receives an e-mail notifying them of their graduation status.

Application Process for the Bachelor of Science

Students must file a formal application for the award of the degree Bachelor of Science from NYU-Poly. Application deadline dates for each semester are e-mailed to the students approximately two to three months before the date. Students who do not file by the published deadline date become candidates for the next graduating class.

Applications for BS degrees are available on PeopleSoft Self-Service. Degrees are certified and diplomas issued twice a year, typically at the end of January and middle of May. Commencement is held once a year, usually in mid-May. All work for the degree must be completed and submitted before the graduation date.

Diplomas

Diplomas are mailed to the student about eight weeks after the degree conferral date. Diplomas are issued only once, subject to rare exceptions made on a case-by-case basis. All replacement diplomas are printed with the Institution name at the time of the student’s graduation and are subject to a replacement diploma fee. Further information can be found on the Registrar’s website.

Transcripts

The issuance of transcripts and generally the release of any information about a student are subject to the provisions of Public Law 93- 380, the Family Educational Rights and Privacy Act of 1974, as amended. Unless NYU-Poly’s disclosure policy permits otherwise, official transcripts of the scholastic record are issued only upon the submission of a written request or upon the submission of a signed release from the student.

Unofficial transcripts are available to students through the Student Self-Service system. Those students without access to the Student Self-Service system may submit a written request for an unofficial transcript. A fee is charged for each unofficial or official transcript issued.

NYU-Poly reserves the right to withhold a transcript if a student fails to meet financial indebtedness to NYU-Poly.

Upon graduation, students should review their transcripts carefully and report any errors to the Office of the Registrar before the record is sealed.

Class Standing for Undergraduates
Students are classified at the end of each semester by the Office of the Registrar on the basis of earned and/or approved transfer credits beginning September 1, as follows:

- **Freshmen**: 1 - 27 credits
- **Sophomore**: 28 - 61 credits
- **Junior**: 62 - 94 credits
- **Senior**: 95 or more credits

**Academic Year Full Time**

Undergraduate students registered for 12 or more credits per semester are categorized as full time. The normal course load for full-time undergraduate students is 14-18 credits.

For certain types of attendance and enrollment certifications, some students who are registered for less than 12 (undergraduate) credits may be certified as full time—specifically undergraduates pursuing Institute-authorized full-time, full-semester co-op work assignments. A form to establish full-time equivalency is available from the Office of the Registrar's website.

**Academic Year Part Time**

Students registered for less than 12 credits per semester (except summer) are categorized as part time. Part-time students pay tuition at the prevailing per-credit rate and are ineligible for most financial assistance and scholarship programs.

**Summer and Intersession**

Students may register for up to 8 credits during each six-week summer term and for no more than 16 credits for the combined 12-week summer term. Six credits for a given summer term is considered full-time status.

**Undergraduate International Students**

**Full-Time Status, Program and Degree Changes, Employment**

To maintain non-immigrant student status, international students must enroll full time, taking at least 12 credits on the undergraduate level for each fall and spring semester. Moreover, they may only register for one online course per semester. Students wishing to take more than one online course per semester must obtain prior approval from the Office of International Students and Scholars (OISS). Students may take less than a full course of study if fewer credits are needed during the last semester to graduate or for valid academic and medical reasons. All reasons for exceptions must be approved in writing by OISS before the last day of late registration each semester so that courses can be added to students’ schedules if necessary.

Students in F-1 and J-1 status must obtain written permission from OISS to withdraw from classes, if the withdrawal will result in less than a full-time course load, or to take a leave of absence. They must also obtain written permission and a pertinent I-20/DS-2019 form from OISS before enrolling in a new degree program. The process of withdrawing from a course, changing degree level or taking a leave of absence through the Office of the Registrar keeps a non-immigrant student in good standing only with
the Institute, but not with the U.S. Immigration and Citizenship Services (USCIS). In addition, students who plan to work as part of their course work or as part of an internship placement are required to obtain prior approval from OISS for any such employment.

Failure to comply with the immigration requirements for full-time status, course withdrawals, degree changes and/or leave of absence and employment violates the nonimmigrant student status and makes a student ineligible for any benefit of that status. According to the USCIS, lack of compliance may also result in deportation.

**Policies on Undergraduate Grading and Grades**

**Computing the Grade-Point Average (GPA)**

The Office of the Registrar determines the GPA of undergraduate students according to the following numerical values assigned to letter grades:

<table>
<thead>
<tr>
<th>Grade</th>
<th>Point Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>4.0</td>
<td>Excellent</td>
</tr>
<tr>

after 180 days

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUD</td>
<td>Audit</td>
</tr>
<tr>
<td>P</td>
<td>Pass</td>
</tr>
</tbody>
</table>

In computing GPAs, NYU-Poly does not consider or count courses graded W, I, S or U toward the total credits passed or earned. GPAs are computed by multiplying the numerical grade in each course by the number of credits for each course, adding these products for the courses taken and then dividing this sum by total number of credits represented by courses considered.

The W and I grades are described in greater detail in subsequent sections. Grades S or U are used to indicate progress in multi-semester research projects or theses, or for non credit-bearing remedial or other courses. Undergraduates enrolled in graduate courses may not receive grades of D or AUD.

**Course Withdrawal: The W Grade**

Students may withdraw from a course or courses without academic penalty until the published withdrawal deadline of the normal fall or spring semester. Students should process their own withdrawals online via Student Self-Service. No approvals are required, but students are encouraged to consult with their academic advisers as withdrawing from certain courses may delay their planned graduation date. When the course duration varies from the norm, such as in six-, nine- or 12-week courses, withdrawal must be completed before two-thirds of the sessions are completed. Withdrawals must be processed online by 11:59 p.m. on the withdrawal deadline indicated on the published Academic Calendar. Withdrawn courses remain on the student’s transcript with a grade of W and are not calculated into the GPA. Once entered on the student’s record, a W cannot be changed to any other grade. An F grade is recorded for any student who ceases to attend a course without formally withdrawing in the required fashion by the required deadline. Students are also encouraged to consult with Financial Aid before withdrawing from a course, as it may affect their status and eligibility for aid.

**Auditing Classes**

Undergraduate students may be allowed to audit certain classes in order to fill the gap which may exist in their prior course work. Approval of the academic department is required prior to auditing a class. The credits for the course do not count as a part of the student’s semester credit load. Students auditing a course will not receive a grade for the course and the course will be annotated by AUD without counting towards student’s GPA calculations. Students who decide to audit a class must do so during their initial registration for the class by filling out the form available from the Office of the Registrar; this option cannot be changed once selected.

**Incomplete Grades**

If a student cannot complete the course work at the usual time because of valid reasons, such as illness or other critical emergency, the instructor may give a grade of Incomplete/I. In such cases, the instructor and the student must develop a detailed plan for completion which includes a specific completion date. Ordinarily, this date should not extend beyond the intersession, in fairness to students who finish course requirements on time and to ensure that students complete prerequisites for advanced courses. An I grade lapses into an F if the student fails to complete the work within the specified completion time line, or at most by 180 days after the semester’s end in which the student was enrolled in the course for which the I was given. All I grades must be converted before graduation.

The grade of Incomplete/I is used sparingly and only in cases with valid reasons, not merely because students have planned poorly or overloaded themselves. An I grade should not be issued if a student is unable to complete the course requirements without attending or participating in the course a second time. If the student reregisters for a course in which an I grade was given, the I grade lapses to an F. If successful resolution of an I grade would require the repetition of any course or portion of a course, the student should consider formally withdrawing from the course.
Change of Grade

Instructors may change grades for academic reasons after assigning an initial grade. The time period for change of grade is one year after the course was completed. Change of grade requests by instructors will not be processed after this one-year period. Changes requested later than this one-year period will be accepted only in case of errors or other administrative action and have to be approved by the Associate Provost of Undergraduate Academics.

Repeating Courses

If an undergraduate student takes a course two or more times, only the second and subsequent grades will count toward their GPA. This policy holds regardless of the first and second grades earned, even when the second grade is lower than the first. The repeated course must be taken within one year of the first course, or at the first time it is offered, where a course is unavailable to repeat within one year. If the student first repeats the course more than one year after taking it initially, and the course has been offered, all grades earned in the course will be counted in the student's GPA. If a student earns a passing grade and subsequently fails the course, the passing grade can be used to satisfy degree requirements.

No undergraduate course may be repeated more than twice, for a total of three attempts. If a student earns an F grade in each of their three attempts in a prerequisite course or a degree requirement, the student is then academically disqualified.

Undergraduate Academic Standing and Probation

Dean's List

Undergraduate students who achieve a semester GPA of 3.4 or better, with no grades of F, I or U for the semester, and are otherwise in good academic standing, are commended by the Department of Academic Success and placed on the Dean’s List. This list is posted following the fall and spring semesters for full-time students and following the spring semester for part-time students. Only those who complete 12 or more credits during the fall or spring semester (or fall and spring semesters combined for part-time students) are eligible. Students who include project courses in their 12 or more credit programs are also eligible, provided that these courses represent no more than one-half of the credit load for a given period and all of the aforementioned requirements are met. Nondegree credit courses, such as EN 1080W, may count toward the 12-credit requirement. The Dean’s List notation appears on the student’s permanent record. Students who receive a grade of F and then repeat the course in a subsequent semester, thereby excluding the first grade from the GPA calculation, are not eligible for the Dean’s List. However, students who convert a grade of I to a regular letter grade or receive a change of grade after a given semester that would then qualify them for the Dean’s List may retroactively receive Dean’s List honors by bringing the change to the attention of the Department of Academic Success.

Any change of grade should be finalized within one semester to be considered for the Dean’s list.

General Academic Standing

To remain in good academic standing, undergraduate students must maintain term and cumulative GPAs of 2.0 or greater. In addition, students must successfully complete a minimum number of credits for each semester of full-time study, excluding summers and mini-sessions. In the case of part-time students, a semester indicates the point at which 12 or more credits are undertaken. Thus, the first semester of study ends when 12 credits are accumulated; the second semester is calculated from that time onward until 24 credits are accumulated. According to these semester equivalents, grade-point requirements for part-time students follow those for full-time students.
The minimum number of cumulative credits to be achieved by the close of each semester of full-time study appears in the following table.

**Minimum Credits and Minimum GPA Required by Semester of Full-Time Study**

* Any time a student’s cumulative GPA falls below 1.5 they are placed on Final Probation regardless of how many credits they have completed.

In calculating the number of successfully completed credits:

1. Courses for which a student received an F grade do not count toward the minimum credit earned.
2. If a student receives an F grade in a course which they repeat within one academic year, their GPA will be recalculated using the second grade earned and the first grade of F will be removed from the GPA calculation.
3. Credits with an I grade will be counted toward enrollment for one year. At the end of that time, any I grade that has not been changed by the instructor on record will automatically become an F grade.
4. Credits assigned a W grade do not appear in the calculation of credits undertaken, earned or successfully completed.
5. Transfer students will enter this table from the point at which their transfer credits place them.

A second requisite for enrollment is the maintenance of a 2.0 GPA or better or performance approaching 2.0 in a steady and realistic fashion. The table above contains the absolute minimum cumulative GPA to be achieved by the close of each semester of full-time or full-time equivalent enrollment.

The Department of Academic Success regularly monitors all undergraduate students and reviews their academic records after each semester and informs their academic adviser or other representatives from the student’s major department of the results of that review. Students identified as being in academic difficulty may not register for more than 12 credits per semester unless otherwise approved by their adviser. Students in academic difficulty are placed on academic probation following the steps and actions described below.

**Academic Warning**

Students whose midterm grades show they are in danger of failing a course receive e-mails of academic warning. The e-mails provide guidance for the student and invite them to meet with their academic adviser to discuss their academic performance and what steps to take to complete their course(s) successfully.
**Academic Probation**

Students are placed on academic probation when (1) their semester and/or cumulative GPAs fall below 2.0, but remain above the minimum standards as outlined above or (2) their number of successfully completed credits falls below the minimum standards as outlined above. Students falling into these categories are notified and directed to meet with their advisers. Students placed on academic probation are limited to a maximum of 18 credits per semester while on probation, unless otherwise approved by their adviser and the Office of Undergraduate Academics.

All first-year, first-time probationary students must take SL 1020, Academic Skills Seminar. The seminar consists of eight one-hour sessions, meeting weekly and taken on a pass/fail basis. SL 1020 helps students develop and enhance an awareness of their individual learning styles, study skills and time management techniques so they may be more successful students and return to good academic standing. Topics include establishing a mind-set for success, discussing career opportunities, setting goals, managing time, overcoming procrastination, learning study and test-taking skills and self assessing. SL 1020 is offered in small, interactive group sessions to support students as they develop strategies for academic success.

**Final Probation**

Students whose academic record indicates an unacceptable level of academic progress may be placed on final probation. Notified of their standing, these students must meet with their adviser to determine a study program and are limited to a maximum of 12 credits while on final probation to improve their academic performance. Should a final probation student need additional credits to satisfy the full-time requirement, he or she may be allowed to register for another course with the approval of their adviser and the Office of Undergraduate Academics, but will be limited to a maximum of 14 credits. Academic Disqualification results from failure to improve performance and to meet the minimum progress requirements as outlined in the minimum-progress table above.

**Disqualification**

The Academic Standing Committee, comprised of members of the Department of Academic Success, faculty and a representative of the student’s major department, shall jointly disqualify from the Institute any student whose cumulative GPA or number of credits successfully completed falls below the approved minimum shown in the above table for two consecutive semesters. Additionally, a major department may disqualify a student at or above the minima listed if it is indicated that continuation will not lead to a successful completion of degree requirements. If a student is disqualified, they will be notified via letter and e-mail.

Extenuating circumstances, such as serious medical problems (physical or psychological), must be documented by the Office of Student Affairs and can lead to a one-semester waiver of these criteria. Performance in the subsequent semester must meet minimum standards. Such arrangements must be made with the head of the major department and the Office of Student Affairs.

**Disqualification Appeal**

Students who would like to appeal their academic disqualification can begin the appeal process immediately. The disqualification appeal form is available from the Registrar’s website. Students must begin the disqualification appeal process a minimum of three weeks before the first day of classes of the semester immediately following their disqualification. If students do not begin the appeal process by this deadline they must wait for one academic year before they can reapply for readmission to the Institute and initiate the appeal process.

**Leave of Absence and Withdrawal from the Institute**
Leave of Absence

Undergraduates taking a leave of absence must obtain permission from the Academic Advisement Center (first-year students) or the Office of Academic Affairs (sophomore-senior students). Leaves of absence, if approved, are granted for a maximum of one year except in extreme cases. If the student does not return to the Institute after their official leave of absence is over, they will be required to reapply to NYU-Poly.

The policy includes an exception for veterans who leave the degree program for military service.

Leave of Absence and Readmission for Veterans

Undergraduate veteran students taking a leave of absence for military services will be readmitted with the same academic status and into the same degree program they had when they last attended the institution. The length of absence cannot exceed five academic years. If the period of absence exceeds five academic years, veteran students must obtain permission from the Dean of Undergraduate Academics. Such requests, when approved by the Dean’s office, will constitute assurance of readmission to the degree program from which the leave was taken. If the period of absence exceeds the approved leave from the Dean’s office, students must apply for readmission.

The policy includes exceptions for veterans receiving a dishonorable or a bad conduct discharge, or who are court-martialed.

Total Withdrawal

Undergraduate students must notify the Office of Academic Affairs if they withdraw completely from the Institute before the deadline published on the academic calendar and during a semester in which they are registered. No total withdrawal is official unless a written form is approved by and submitted to the Office of the Registrar. Mere absence from courses does not constitute official withdrawal, but will lead to F grades recorded for courses not completed. To receive W grades for the semester, the withdrawal must be completed by the withdrawal deadline indicated on the academic calendar.

Involuntary Withdrawal

NYU-Poly is concerned about the health, safety and well-being of its students. Students judged to be a threat to themselves or to others may be withdrawn involuntarily from NYU-Poly. The Institute seeks, whenever possible, to allow such students to continue as active students if they agree to undergo professional care. Full details on this policy are available from the Office of Student Development.

Automatic Withdrawal

Undergraduates who do not formally file a leave of absence and who are not continuously enrolled are automatically withdrawn from the Institute. Students in this category must apply for readmission. If readmission is granted, students will be governed by the catalog and rules in effect at the time of readmission.

Readmission

Students applying for readmission must do so through the Office of Undergraduate Admissions. The student’s application for readmission will be sent to the student’s academic department for evaluation. The academic department in consultation with the Office of Academic Affairs and Associate Provost of Undergraduate Academics determine whether the student is eligible to continue his/her studies at NYU-Poly.
Graduate Academic Requirements and Policies

This section details the general Institute-wide degree requirements that apply to all Polytechnic graduate degrees. Academic departments may place additional requirements on individual degrees. Such additional requirements are explained in the programs section of this catalog. In no case may a department specify requirements less stringent than those indicated here. Master’s degrees and certificate programs are the purview of the Associate Provost for Graduate Academics and PhD programs are the purview of the Associate Provost for Research and PhD Programs.

Outcomes Assessment

Polytechnic conducts outcomes assessment activities to monitor student academic achievement, effective teaching methods and continuous improvement of the Institute, as well as to comply with accreditation standards. To obtain periodic measurements of student perceptions and intellectual growth, graduate students are strongly encouraged to participate in surveys, focus groups, interviews or related activities. While individual input is collected, data resulting from these assessments is published only in aggregate form.

Definition of Credits

Graduate studies are expressed in terms of credits. One 50-minute period of graduate class work for a 15-week, single semester carries 1 graduate credit. A standard graduate course meeting for two-and-a-half hours per week in a single semester of 15 weeks is equivalent to 3 credits. This format is the most common for graduate courses. Graduate laboratories meet three times per graduate credit (i.e., two-and-a-half-hours per week in a single semester of 15 weeks is equivalent to 1 credit). Courses meeting more or less than two-and-a-half hours each week are assigned credits in the correct proportion. The final examination period is an integral part of the 15-week semester.

Graduate Degrees and Advanced Certificates

Master of Science

Admissions

Admission to Master of Science programs requires a bachelor’s degree and at least four years of college-level courses in a preparatory discipline from an institution acceptable to Polytechnic. An undergraduate GPA of 3.0 or better is needed for admission. GRE scores are recommended for all applicants. The scores are needed from those seeking merit-based scholarships. Effective Spring 2013, GRE scores are mandatory for students seeking full-time study, including all international students and those wishing to enroll for 9 or more credits per term. Applicants seeking admission to technology management related degrees may submit the GMAT score instead of GRE. Letters of Recommendation, a Statement of Purpose, and a professional resume are also needed for admission.

Graduation Requirements

Candidates for the degree Master of Science must complete no fewer than 30 credits of advanced study and/or research beyond the bachelor’s degree in the program selected. Academic departments may require additional credits for individual degrees. Specific course requirements for each MS program are detailed in the programs section of this catalog. To obtain the MS degree, students must maintain a Cumulative GPA of 3.0 (equivalent to a B letter grade) or better in all graduate work undertaken at Polytechnic, including those not used to fulfill specific program requirements. The average of B or better includes all guided studies, readings, projects, theses and dissertations. Students may offer no more than a combined total of 9 credits of project,
guided studies and/or thesis toward fulfillment of the MS degree requirements. Students taking project or thesis must register for at least 3 credits of project and/or thesis every semester until the work is completed and a grade recorded (also refer to the section Maintenance of Study).

**Residency Requirements and Transfer Credits**

A maximum of 9 credits may be accepted as transfer credits, if approved by the student’s department/program. Thus, graduate students in the MS programs must take a minimum of 21 credits of graduate work at Polytechnic for a 30 credit MS degree. Credits transferred must be from graduate courses taken elsewhere (see sections Transfer Credits and Multiple MS Degrees for exceptions), as long as those courses were taken after the undergraduate degree, not used to satisfy the graduation requirements for any undergraduate degree, and had a grade of B or better (also refer to the section Transfer Credits). Theses, projects and guided studies or readings courses cannot be transferred. Students must complete all requirements for the MS degree within a period of no more than five years after beginning their graduate studies at Polytechnic. This period includes any approved Leave of Absence. Extensions of this period are rarely granted and require prior approval from the respective Associate Provost. Students must request an extension at least 60 days before the 5 year period is reached. Individual programs may specify required courses, minimum GPAs in specific courses or course groups, and/or require a comprehensive examination, presentation of a seminar or completion of a project or thesis.

One exception to the paragraph above regarding transfer credit and graduate validation credit: Mathematics graduate students (MS and PhD) will be permitted, with adviser approval, to exceed the 9-credit limit on transfer credit and validation units by taking specified adviser-approved courses at Courant Institute of NYU. In the case of MS students such approval may not raise the number of such courses above 4.

**Master of Engineering**

The admissions, graduation, residency requirements and other regulations are the same as those for the Master of Science. The Master of Engineering is for students seeking in-depth knowledge in fields requiring courses from multiple disciplines, especially those taught by several different academic departments. Students create their study program, including at least one graduate certificate, with the approval of a graduate adviser. A capstone experience is required for graduation. Candidates for the degree Master of Engineering must complete no fewer than 30 credits of graduate courses and/or research beyond the bachelor’s degree in the program.

**Doctor of Philosophy**

Requirements for the degree Doctor of Philosophy are qualitative and quantitative. Students will find that the formal requirements of residence, course credits and dissertation provide a framework within which they are free to construct individual programs for creative learning at an advanced level.

Graduate students wishing to enter into a systematic program leading to a PhD should confer with an adviser in the department of major interest regarding (1) selection of courses, (2) major and minor fields of study, (3) formulation of a guidance committee, (4) qualifying and language examinations and (5) degree candidacy. Students must satisfy the detailed requirements of the selected degree program.

**Admissions**

Students may apply to the doctoral program either directly after a bachelor’s degree or after completing a master’s degree. In either case GPAs greater than 3.0 are needed in all previous degree programs and GPA greater than 3.5 is typically expected. Admissions requirements for the doctoral program are at least as stringent as those of the MS, and the admissions process follows the same path as that of the Master of Science and Master of Engineering applications. Because doctoral research is a one-to-one
match between an applicant’s research interests and those of a faculty member, applicants need to discuss their interests with the faculty in their program of interest. Highly qualified candidates whose interests are incompatible with the faculty’s research interests may not be admitted. Additionally, most departments admit only the number of students that they can financially support and qualified candidates may not be admitted because limited funds can support only a given number of students.

**Graduation Requirements**

All doctoral students must maintain a GPA of 3.0 or better at all times and a B or better for the dissertation. Some departments have specific course or grade requirements that must be fulfilled. They must pass the qualifying examination(s) administered by their department or program and complete and defend a doctoral dissertation. Students may not register for dissertation research until they have passed the doctoral qualifying examination given by their major department. These examinations are generally scheduled once or twice yearly, and students should consult the academic department for information. Once students start their dissertation, they must register for at least 3 credits every semester until the dissertation is completed and accepted (also refer to the section on Maintenance of Study).

**Residency Requirements and Transfer Credits**

All doctorate candidates must complete a minimum of 75 credits of graduate work beyond the bachelor’s degree, including a minimum of 21 credits of dissertation research (or more, depending on major). They must take a minimum of 27 credits, including all dissertation credits, at Polytechnic. Transfer credits can include a 30-credit blanket transfer for a prior MS degree and additional courses not included in the prior MS that are individually transferred. For the blanket 30-credit transfer, the prior MS need not be a 30-credit MS. Additional courses individually transferred cannot include project, thesis, dissertation, guided studies or readings, or special topics credits. Full-time students must complete all PhD work within six calendar years counted from the time of admission to graduate work at Polytechnic. Part-Time students must complete within 12 years. This period includes any approved leave of absence. Any extension of these periods requires prior approval of the respective Associate Provost. Students must request an extension at least 60 days before the time period is up.

**Milestones**

Students in the PhD program must take and pass doctoral qualifying examination(s) administered by their programs. Students are highly encouraged to take the examination(s) in their first year of the program. If students have not passed the examination(s) by the end of their second year, they may be disqualified permanently from the PhD program. Students cannot register for dissertation credits unless they have passed the qualifying examination(s). Within six months of passing the examination(s), the student and the dissertation adviser must form a dissertation-guidance committee. This committee oversees course selection for the student, provides research guidance and ensures that satisfactory progress is being made toward completion of the dissertation in a timely manner. Course selection must ensure that requirements of major and minors set forth by the respective programs are met. The committee, at its discretion or bound by departmental regulations, may request the student to present a dissertation research proposal. The committee is expected to meet at least once per semester to assess the student’s progress. The doctoral student defends the dissertation in front of this committee. The student must obtain a checklist of the milestones and requirements from the respective Associate Provost.

**Graduate Advanced Certificate Programs**

Polytechnic offers several graduate advanced certificate programs in specialized subject areas for students who do not wish to enroll in a full-degree program. Students must apply for a certificate, be admitted, and enroll officially in a certificate program when they begin Polytechnic graduate study. Detailed descriptions of the certificate programs are available from the responsible departments.
Depending on the program, 12 to 15 credits must be taken at Polytechnic to earn a certificate. Courses taken for a certificate may be applied toward the future pursuit of a MS, ME or PhD graduate degree, but not to another certificate program. No transfer credits are allowed. (See section Transfer Credits for exceptions.) Applicants must be admitted formally to a certificate program before beginning course work. Admission requirements are the same as those for related MS programs. Students must have a cumulative GPA of 3.0 in all graduate courses taken at Polytechnic to receive a certificate. Requirements for certificates must be completed within three years, including any approved Leave of Absence.

Students in such a program who subsequently decide to pursue a graduate degree must file a separate application for admission to the respective graduate program. The following graduate advanced certificate programs are currently available:

- Bioinstrumentation
- Biomedical Materials
- Computer Engineering
- Construction Management
- Cyber Security
- Electronic Business Management
- Entrepreneurship
- Environment-Behavior Studies
- Executive Construction Management (Exec 21)
- Financial Engineering
- Financial Technology Management
- Human Resource Management
- Image Processing
- Information Management
- Integrated Digital Media
- Organizational Behavior
- Power Electronics and Systems
- Power Systems Management
- Project Management
- Risk Management
- Software Engineering
- Technology Management
- Telecommunication Network Management
- Telecommunications Management
- Traffic Engineering
- Transportation Management and Economics
- Transportation Planning
- Wireless Communications

**Graduate Credits and Requirements**

**Residency**

To satisfy residency requirements for a graduate degree at Polytechnic Institute, students must complete the following minimum number of credits at the Institute:

- Master of Science: all but 9 credits needed for graduation (at least 21 credits of residency)
- Master of Engineering: all but 9 credits needed for graduation (at least 21 credits of residency)
• Doctor of Philosophy: 27 credits (including all dissertation credits)
• Graduate Certificate: all credits (see section Transfer Credits for exceptions)

Continuity of Registration

All graduate students must be registered for at least 1.5 credits each fall and spring semester until they graduate. If the student is unable to attend the Institute for a semester, the student must obtain a leave of absence for the semester. Failure to do so requires the student to reapply to the graduate program to resume studies, and no guarantee of readmission is implicit or explicit. Once students have started their dissertation thesis and/or project, they must register for at least 3 credits every semester until it has been completed and accepted. (Also refer to the section on Maintenance of Study.)

Modifications to Curricula

Curricula and courses change from time to time in order to keep students abreast of the latest knowledge and methods within subject areas. Students are required to satisfy the curriculum and degree requirements in effect at the time of their matriculation and must obtain current degree requirements from their program adviser.

In order to accommodate curriculum and course revisions, it is sometimes necessary to substitute a course for one specified in the curriculum. Students may also request course substitutions to tailor their studies to their interests. All course substitutions must be approved by both the program adviser and the Office of the Associate Provost for Graduate Studies.

Transfer Credits

Students may transfer a limited number of credits to meet the requirements for a master’s or doctoral degree at Polytechnic if the graduate courses are (1) consistent with Polytechnic’s residency requirements, (2) completed with grades B or better, (3) from accredited institutions, (4) consistent with the curriculum in which the student is registered, (5) taken after receipt of a bachelor’s degree (with the exception of Polytechnic’s undergraduate students; see below). The student’s major academic department evaluates graduate transfer credits. Credits submitted for transfer are subject to the rules and regulations regarding period of validity, discussed in a subsequent section.

No transfer credit is permitted for graduate certificates. The exception is for NYU-Poly MS alumni who may be allowed to count some graduate course credit from their degrees earned here towards a Graduate Certificate, should they wish to re-enroll in NYU-Poly after graduation. Such credit would be subject to approval by the Certificate Program’s academic adviser. A minimum of 9 new credits must be taken to earn a Certificate under these circumstances.

Grades for transferred credits or courses are not recorded and do not affect the GPA for the graduate program at Polytechnic.

MS or ME students may transfer up to 9 credits. No project, thesis, dissertation or guided studies/readings courses can be transferred.

PhD students may transfer up to 48 credits of course work. Transfer credits for the PhD can include a 30-credit blanket transfer for a prior MS degree and additional courses not included in the prior MS that may be transferred individually. For the blanket 30-credit transfer, the prior MS need not be a 30-credit MS, so long as a MS degree (or equivalent) was granted and a copy of the degree and detailed transcripts are presented. Additional courses individually transferred cannot include project, thesis, dissertation, guided studies or readings, or special topics credits.

Graduate courses taken at Polytechnic while students pursued an undergraduate degree at Polytechnic may be applied subsequently to a graduate degree, provided that they earned a B grade or better and that the individual courses were not used to fulfill requirements for an undergraduate degree at Polytechnic. Such courses are also subject to the 9-credit maximum transfer limitation for the MS degree and the grades are not figured into the cumulative GPA for the graduate program. The policy includes exceptions for students enrolled in a joint BS/MS program with a study plan pre-approved by an academic adviser.
One exception to the paragraph above regarding transfer credit and graduate validation credit: Mathematics graduate students (MS and PhD) will be permitted, with adviser approval, to exceed the 9-credit limit on transfer credit and validation units by taking specified adviser-approved courses at Courant Institute of NYU. In the case of MS students such approval may not raise the number of such courses above 4.

**Period of Validity**

More than undergraduate, graduate courses reflect the current state of the art in their respective fields. Thus, all courses taken more than 10 years before a request date for transfer of credits are ineligible to be transferred individually to Polytechnic by the routine transfer process. The exceptions are approved articulations and administrative actions. The blanket 30-credit transfer into the PhD program for a MS degree taken at Polytechnic or elsewhere is exempt from this period of validity and does not expire.

**Graduate Validation Credits**

When it is unclear whether a course taken outside Polytechnic is suitable for transfer credit, students may qualify for transfer credit for that course by passing a validation examination. Permission to take the examination must be recorded in advance on the student’s transfer-evaluation form. The examination format is at the discretion of the department giving the course. Scheduling of the examination is by mutual agreement, but in no event can it be scheduled more than one calendar year after the student begins study at Polytechnic. A grade of B or better is required for graduate students. An examination may not be taken more than once. A student who registers for or attends the course at Polytechnic forfeits the right to take a validation examination.

The sum of validation credits and transfer credits is limited to 9 credits for the MS and ME degrees.

**Multiple MS Degrees from Polytechnic**

Effective Fall 2009, students pursuing a second or third MS degree from Polytechnic can use up to a maximum of 9 credits from previous MS degree programs attended at Polytechnic for satisfying degree requirements for their current MS program. Courses that are used for this internal transfer within Polytechnic must have a grade of B or better and will count in the total permissible transfer limit of 9 credits for the MS degree. Adviser approval is needed and the student can request this action only after completing 9 credits of course work in the current degree program with a B average.

**Graduate Registration Status**

Graduate students pay tuition at the per-credit rate. Full-time status is defined by the following:

- Full-time MS students are registered for 9 credits or more each semester. Students who are normally full-time may register for fewer credits during their last semester by registering for only the number of credits needed for graduation. During this last semester they are part time, but can be treated as full-time-equivalent for immigration and other legitimate reasons by requesting full-time-equivalency status.
- Full-time MS students in the lock-step, cohort-based, executive-format MS programs are registered for all courses specified by the program published in the catalog each semester. These programs have distinct courses and/or projects, each bearing credits approved for the program, but in no case fewer than 7.5 credits a semester.
- Full-time PhD students may register for a minimum of 3 credits per semester upon passing the PhD qualifying examination. Students must register for 9 credits or more until they pass the PhD qualifying exam. Other students who are not officially enrolled in a PhD program, regardless of whether or not they have passed the qualifying exam, must continue to take a minimum of 9 credits until they change their academic status to PhD.

A status of non-matriculated or visiting student allows students to take up to three graduate courses at Polytechnic without formally applying for admission. If these students desire to continue at Polytechnic as a matriculated student in a graduate degree or certificate program, they must follow the formal application process.
Maintenance of Studies

PhD Students: PhD students who have taken all required courses with minimum dissertation credits and have completed their doctoral research may register for up to two semesters of “maintenance of studies” with no tuition charge (Institute fees apply). This category of registration officially maintains the student’s degree candidacy and extends the time to complete the writing and defending of the dissertation. Students who have not completed their doctoral research must continue to register for dissertation credits.

MS Students: Under exceptional and well-documented circumstances, graduate students seeking a MS degree in a program that requires a MS thesis or MS project may, with the permission of the thesis or project adviser, request one semester of maintenance of study to complete the project or thesis. For permission to be granted, students must provide adequate written justification.

Maximum Time for Completion

Programs for graduate certificates must be completed within three years. The MS or ME degree programs must be completed within five years of starting the program at Polytechnic. The PhD program must be completed in six years for full-time students and 12 years for part-time students from the time of admission to graduate work at Polytechnic. All time limits listed include any approved leave of absence.

Students exceeding these time limits require prior approval to continue from the Associate Provost for Graduate Academics. If granted, not all courses taken previously may count towards the degree. The Associate Provost, consulting with the department, will prepare a plan for the student to follow to obtain the degree.

Graduate International Students

Full-time Status, Program and Degree Changes

To maintain non-immigrant student status, international students must maintain full-time status every fall and spring semester for the entire semester (i.e., withdrawing from a course during the semester may jeopardize full-time status). Students are not required to enroll during the summer semester and may enroll for credits at their discretion. Moreover, they may register only for one online course per semester. Students wishing to take more than one online course a semester must obtain prior approval from the Office of International Students and Scholars (OISS). Students may take less than a full course of study if fewer credits are needed during the last semester to graduate, but they must notify Office of International Students and Scholars (OISS) at the beginning of the semester and obtain full-time equivalency status. Students may also take a reduced course load for valid academic and medical reasons. All reasons for such exceptions must be approved in writing by the Office of International Students and Scholars (OISS) before the last day of late registration each semester so that courses can be added to the student’s schedule if necessary. If the reduction in load is permitted, students are granted full-time-equivalency status for the respective semester.

Students in F-1 and J-1 status must obtain written permission from OISS for any Leave of Absence request, or to withdraw from classes if the withdrawal results in less than a full course load. They also must obtain written permission and the pertinent I-20/DS-2019 form before enrolling in a new degree program. The process of withdrawing from a course, changing degree level or taking a leave of absence through the Office of the Registrar keeps a non-immigrant student in good standing only with the Institute, but not with the U.S. Immigration and Citizenship Services (USCIS), unless proper approval is obtained from OISS. Students who receive Incomplete (I) grade(s) must develop a credible academic plan for completing the requirements of respective course(s) within the following semester. MS students who receive one or more Incomplete (I) grade(s) in the final semester will be allowed to register for maintenance of studies for only one academic semester after the final semester to complete the requirements of the respective course(s). In addition, students planning on employment as part of their course work, or as part of the graduate co-op program internship placement, must obtain prior approval from OISS for any such employment.
Failure to comply with the immigration requirements for full-time status, course withdrawals, degree changes or leave of absence violates the non-immigrant student status and makes a student ineligible for any benefit of that status. According to USCIS, lack of compliance may also result in deportation.

**Policies on Grading and Grades**

**Computing the Grade-Point Average for Graduate Students**

For the purposes of computing GPAs for graduate students and graduate courses, the following schedule is used.

<table>
<thead>
<tr>
<th>Grade</th>
<th>Point Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>4.0</td>
<td>Excellent</td>
</tr>
<tr>
<td>A-</td>
<td>3.7</td>
<td>Excellent</td>
</tr>
<tr>
<td>B+</td>
<td>3.3</td>
<td>Good</td>
</tr>
<tr>
<td>B</td>
<td>3.0</td>
<td>Good</td>
</tr>
<tr>
<td>B-</td>
<td>2.7</td>
<td>Good</td>
</tr>
<tr>
<td>C+</td>
<td>2.3</td>
<td>Deficient, but Passing</td>
</tr>
<tr>
<td>C</td>
<td>2.0</td>
<td>Deficient, but Passing</td>
</tr>
<tr>
<td>F</td>
<td>0.0</td>
<td>Failing</td>
</tr>
<tr>
<td>P</td>
<td></td>
<td>Pass (no GPA value)</td>
</tr>
<tr>
<td>S</td>
<td></td>
<td>Satisfactory</td>
</tr>
<tr>
<td>U</td>
<td></td>
<td>Unsatisfactory</td>
</tr>
<tr>
<td>W</td>
<td></td>
<td>Withdrawal</td>
</tr>
<tr>
<td>I</td>
<td></td>
<td>Incomplete, converts to F after 180 days</td>
</tr>
<tr>
<td>AUD</td>
<td></td>
<td>Audit</td>
</tr>
</tbody>
</table>

Grades S and U reflect progress on research efforts. Once the thesis or dissertation is completed, the letter grade is entered on the transcript. Noncredit seminar courses are also graded S or U. Other than research credits, no credit-bearing courses can be assigned S or U grades, except for approved specific internship courses. The S / U grading scheme of such courses is explicitly stated in the respective course descriptions in the catalog. A student cannot graduate if a grade of U is on the transcript for any such credit bearing course or for research efforts at the time of graduation. A grade of I cannot be assigned to a course that is
graded S or U. Grades S, U, I, W and AUD are not included in computing the GPA, which is computed as indicated for undergraduate students.

**Graduate Bridge and Preparatory Courses**

Many programs offer graduate bridge or preparatory courses to accommodate the needs of students who lack certain undergraduate preparation. Generally, bridge or preparatory courses cannot be used to satisfy degree requirements, particularly for degrees within the department that offers the course. However, these courses are included in the calculation of a student’s graduate GPA. Some graduate students may be required to take certain undergraduate courses as preparation for advanced graduate study. Undergraduate courses are not included in the student's GPA calculation.

**Repeating Courses**

The first time a graduate student repeats a course, the lower grade is not counted towards the GPA. All subsequent grades in a course repeated more than once are included in the GPA, although degree credit is earned only once.

**Course Withdrawal: The W Grade**

Students may withdraw from a course or courses without academic penalty until the published withdrawal deadline of the normal fall or spring semester. Students should process their own withdrawals online via Student Self-Service. No approvals are required, but students are encouraged to consult with their academic advisers as withdrawing from certain courses may delay their planned graduation date. When the course duration varies from the norm, such as in six-, nine- or 12-week courses, withdrawal must be completed before two-thirds of the sessions are completed. Withdrawals must be processed online by 11:59 p.m. on the withdrawal deadline indicated on the published Academic Calendar. Withdrawn courses remain on the student’s transcript with a grade of W and are not calculated into the GPA. Once entered on the student’s record, a W cannot be changed to any other grade. An F grade is recorded for any student who ceases to attend a course without formally withdrawing in the required fashion by the required deadline.

**Auditing Courses**

Graduate students may audit courses instead of receiving credits and grades for them. Regular tuition is charged and courses are treated as part of a full-time load. An AUD notation is made on the student’s permanent record.

Interested graduate students should see their advisers and must notify the Office of the Registrar within the first two weeks of the semester if they select courses for audit status. Under no circumstances may an audit status be changed to credit status once elected. Audited courses do not count toward satisfying graduation requirements.

**Incomplete Grades**

If a student cannot complete the course work at the usual time because of valid reasons, such as illness or other critical emergency, the instructor may give a grade of Incomplete/I. In such cases, the instructor and the student must develop a detailed plan for completion which includes a specific completion date. Ordinarily, this date should not extend beyond the intersession, in fairness to students who finish course requirements on time and to ensure that students complete prerequisites for advanced courses. An I grade lapses into an F if the student fails to complete the work within the specified completion timeline, or at most by 180 days after the semester's end in which the student was enrolled in the course for which the I was given. All I grades must be converted before graduation.
The grade of Incomplete/I is used sparingly and only in cases with valid reasons, not merely because students have planned poorly or overloaded themselves. An I grade should not be issued if a student is unable to complete the course requirements without attending or participating in the course a second time. If the student reregisters for a course in which an I grade was given, the I grade lapses to an F. If successful resolution of an I grade would require the repetition of any course or portion of a course, the student should consider formally withdrawing from the course.

**Change of Grade**

Instructors may change grades for academic reasons after assigning an initial grade. The time period for change of grade is one year after the course was completed. The Registrar will not process change of grade requests by the instructors after this one-year period. Changes requested later than this one-year period are accepted only in case of errors or other administrative action and must be approved by the respective Associate Provost.

**GPA Restart**

If a student has completed a master’s degree at the Institute and then pursues another master’s degree at the Institute, the student’s GPA is re-started. In this way, the academic performance for each degree is accurately represented.

GPA’s may also be restarted for graduate students pursuing a master’s degree under the following conditions: (1) the student changes major to a significantly different field of study and the change is approved by both the new department and the Associate Provost for Graduate Academics, and (2) the student requests that the GPA be restarted and the request is approved by the Associate Provost for Graduate Academics. The request to restart the GPA must be made during or before the first semester in the new major. Courses taken before the GPA restart cannot be counted towards satisfying the degree requirements of the new major. A GPA restart is only for the master’s degree; a GPA cannot be restarted at the beginning of the PhD degree program. A GPA cannot be restarted during PhD degree program. Any GPA restart is noted on the student’s transcript.

**Continuation of Studies Beyond the Initial Master of Science**

Students planning to pursue additional studies immediately following the award of an advanced degree by Polytechnic should complete a Request for Continuation of Studies form in lieu of a new application for admission and submit it to the Graduate Admissions Office for review and approval to the department in which the new degree will be pursued. This form is available from the Office of the Registrar. Examples are (1) progressing from a MS program to a PhD program or (2) seeking a second MS degree from Polytechnic. In the latter case, students should be aware that Institute regulations govern graduate credits applied toward the first degree to be applied toward a second MS degree, see section Transfer Credits for rules on Certificates and section Multiple MS Degrees from Polytechnic.

**Academic Standing and Probation**

Graduate students are expected to progress in their studies and maintain a minimum 3.0 GPA at all times. Failure to do so results in the student being placed on academic probation. Graduate students cannot be on academic probation for more than two semesters. These semesters need not be sequential.

A student who is on a second semester of probation must have a GPA of 3.0 or above at the end of that semester. If the student does not, then the student will be disqualified from the Institute and, with rare exception, will not be readmitted.

A student's GPA and probationary status are evaluated at the end of the spring and fall semesters, irrespective of any grades of I or S. If a student is disqualified, no further grade changes are permitted (except in cases of clerical errors). If a student is disqualified, any grade of I or S at the time of disqualification will remain as such on the student's transcript.
If a student's GPA is below 3.0, he or she will be placed on probation and notified by the Office of Graduate Academics. If the student is on their second probation, the notification from the Office of Graduate Academics will indicate that the student is on final probation. Students on probation have until the next GPA evaluation (end of spring or fall semester, whichever comes first) to improve their GPA.

Students on probation must submit a signed GPA Deficiency Form to the Office of Graduate Academics before the start of the next semester. If they do not, they will be de-registered from their courses. Students who are not registered will not be permitted to do so until the form is received by the Office of Graduate Academics. Further, students on probation must obtain permission from the Office of Graduate Academics if they wish to change their registration. The registration hold and the GPA Deficiency Form serve to remind the students on probation that they are not performing at the required academic standard.

No indication of academic probation appears on a student's transcript, but a record is kept on file. Academic disqualification is noted on the student's transcript.

In addition to the academic probation process described above, a major department may request that a graduate student be placed on academic probation at any time. The request and its justification are signed by the department head and sent to the Office of Graduate Academics for approval.

**Withdrawal from the University**

**Voluntary Withdrawal**

Graduate students must notify the Office of Graduate Academics if they withdraw completely before the deadline published in the academic calendar and during a semester in which they are registered. No complete withdrawal is official unless a written form is approved and submitted to the Office of the Registrar. Mere absence from courses does not constitute official withdrawal, but leads to F grades recorded for courses not completed. To receive W grades for the semester, the withdrawal must be completed by the withdrawal deadline indicated in the academic calendar.

**Involuntary Withdrawal**

Polytechnic is concerned about the health, safety and well-being of its students. Students judged to be a threat to themselves or to others may be withdrawn involuntarily from Polytechnic. The Institute seeks, whenever possible, for such students to be allowed to continue as active students if they agree to undergo professional care. Full details concerning this policy are available from the Office of Student Development.

**Leaves of Absence and Readmission**

**Leave of Absence**

A student who must temporarily withdraw from graduate studies for serious illness, national service, or compelling personal reasons may request a leave of absence. If a leave of absence is approved by the Associate Provost for Graduate Academics, the student's matriculated status is maintained, and the student may resume his or her studies after the leave of absence. The registrar will record a leave of absence on the student's transcript.

Leaves of absence, if approved, are granted for a maximum of one year except in extreme cases, such as compulsory national service (if such service is for more than one year). Foreign students must also contact OISS. An approved leave of absence is an
academic decision; it does not override OISS concerns. The leave of absence does not extend the time limits for earning a degree (see section on time limits). The approval of a leave of absence does not preclude subsequent academic disqualification.

Students who do not maintain continuous registration and do not have an approved leave of absence must apply to NYU-Poly for readmission if they wish to continue their graduate studies. Re-admitted students must pay accrued fees for the lapsed semester(s). If readmitted, their subsequent program attendance will be guided by the terms and conditions of the readmission and by the catalog and rules in effect at the time of readmission (see section on readmission). Lapsed semesters do not extend the time to degree. If students who re-apply cannot complete their studies within the allotted time for degree, they can be re-admitted as a new student, but prior courses will be treated as part of the total transfer credits permitted (see section on Transfer Credits).

Once PhD students begin their dissertation project, they must register continually for dissertation credits or maintain their studies through an approved leave of absence or, if they have completed their research, by registering for maintenance of studies (also refer to the section on Maintenance of Studies).

**Leave of Absence and Readmission for Veterans**

Veteran students in graduate programs taking a leave of absence to perform military services are readmitted with the same academic status and into the same degree program that they had when last in attendance at the institution. The length of absence from the institution cannot exceed five academic years. If the period of absence exceeds the period of five academic years, veterans must obtain permission from the respective Associate Provost. Such requests when approved by Office constitute assurance of readmission to the degree program from which the leave was taken. If the period of absence exceeds the approved leave from the respective Associate Provost students must apply for readmission.

The policy excludes veterans receiving dishonorable or bad conduct discharges, or who are sentenced in a court-martial.

**Automatic Withdrawal**

Graduate students who do not formally file a leave of absence, or those who do not register for the semester beyond any authorized leave, are automatically deactivated. Students in this category must apply for readmission and no guarantee of readmission is made either implicitly or explicitly. If readmission is granted, students will be governed by the catalog and rules effective at the time of readmission and the terms and conditions of the readmission.

**Application Process for the Award of Master of Science and Doctor of Philosophy Degrees**

Graduate students must file a formal application for the award of any Polytechnic degree or certificate. Filing dates for each semester are published by the Office of the Registrar. Students who do not file by the published deadline dates become candidates for the next graduating class.

Applications for the MS degree and graduate certificate are available online on the Graduate Admissions website. Applications for the PhD degree are also available in the Office of the Associate Provost for Research and PhD Programs. Degrees are certified and diplomas issued twice a year, at the end of the fall and spring semesters. Degrees are conferred at the annual spring commencement held in late May or early June. All work for the degree must be completed and submitted before the date of graduation.

Filing fees for diplomas are payable at the time of filing in the Office of Student Accounts. If the award of a degree is delayed, diploma fees are not charged again. By faculty vote, degrees are not awarded to members of the Institute teaching staff who hold the rank of assistant professor or higher.
Please note that a degree is not awarded unless the student applies for the award, even if all requirements are completed. The date of the degree follows the application date for its award, not when all requirements are completed. If the application is filed more than two years of completion of degree requirements, the approval process once an application is made is not automatic and additional administrative actions may be required on a case-by-case basis.

**Diplomas**

Diplomas are mailed to the student about eight weeks after the degree conferral date. Diplomas are issued only once, subject to rare exceptions made on a case-by-case basis. All replacement diplomas are printed with the Institution name at the time of the student’s graduation and are subject to a replacement diploma fee. Further information can be found on the Registrar’s website.

**Projects, Theses and Dissertations**

**Graduate Research**

Investigations undertaken for graduate research help develop students’ independent and creative thinking. Through this type of study, students are trained to analyze, research, synthesize and to contribute to the advancement of science and engineering.

Research for an advanced degree embodies knowledge of the field of mathematics, science or engineering chosen by the candidate, encompassing an understanding of basic principles, together with commensurate acquaintance with current practices, the literature and the work of leaders in the field of study.

MS students may elect to complete a MS project or MS thesis and may be required to do so in certain programs. Consult the programs section in this catalog for details. A thesis is generally a more extended piece of work, usually entailing 6 to 9 credits, while the project usually entails 3 to 6 credits. At this level, research should exhibit a thorough understanding of advanced scientific thought or an ability to apply advanced principles constructively to engineering planning and design.

Each PhD student must complete a PhD dissertation. Research at this level must demonstrate critical and constructive thought as well as the ability to use the techniques necessary to explore and develop new knowledge in mathematics, science or engineering. A successful dissertation must demonstrably advance the subject area of research. Institute requirements for dissertations set a minimum of 21 credits of registration. All research should be characterized by accuracy of observation and measurement and by clarity and completeness in presentation. The conclusions presented must be supported by adequate studies and investigations and supplemented by a complete bibliography.

**Registration for Projects, Theses and Dissertations**

After a project, thesis or dissertation adviser and/or guidance committee is appointed, candidates should register each semester for the number of credits that realistically reflects the amount of time and effort they expect to devote to research. They must continually register each fall and spring until they complete their research and pass the required final examination such as project, thesis or dissertation defense. (Also refer to the section on Maintenance of Study). Registration (or maintenance of studies) cannot be interrupted until a grade is entered on the permanent record except with the permission of the respective Associate Provost. If, at the end of any semester, the adviser deems unsatisfactory any work covered by the credit of registrations, students may be required to re-register for the same unit and be obligated to pay full tuition and laboratory fees.

PhD students must continue to register for at least 3 credits of dissertation until they complete all research and the dissertation. Students may register for two semesters of “Maintenance of Study” if they have completed all research and have to finish only writing, defending or revising their dissertation in that semester. Similarly, MS candidates registered for thesis or project may, under well-documented circumstances, apply for one semester of “Maintenance of Study” as described above.
Manuscript Presentation

Degree candidates must present their research to the appointed guidance committee in final manuscript form for official acceptance no later than two weeks before the end of the semester. The accepted format for the bound research document is detailed in the “Regulations on Format, Duplication and Publication of Project Reports, Theses and Dissertations.” Detailed information is available on the NYU-Poly website.

Graduate students registered for MS Project, MS Thesis, or PhD Dissertation credits must submit four final bound copies to their department for necessary signatures and then present them to the Office of the Graduate Center one week before the end of the semester.

Publication

Doctoral dissertations are published by UMI Dissertation Publishing (ProQuest). The cost of this service is charged to the student. By publishing with UMI, it ensures the dissertation thesis gains the widest possible audience. Any interested person can purchase copies of a dissertation through the company’s website.

The faculty regards publication of the major content of a doctoral dissertation in a recognized scientific journal as a necessary final step if the work performed is to achieve maximum usefulness. The publication must indicate, by footnote or otherwise, its basis as a Polytechnic Institute of New York University dissertation.

Academic Success, Advising and Tutoring Services

The mission of the Department of Academic Success is to enhance the likelihood of students successfully completing their studies at the Institute. To this end, academic support functions are integrated and delivered comprehensively and seamlessly.

To ensure students’ needs are addressed, Polytechnic has coordinated services among all areas reporting to the Department of Academic Success and key offices overseen by the Division of Student Affairs. To meet the department’s mission, faculty are also involved in its activities.

The Department of Academic Success addresses a range of needs for first-year students—from proper course placement to advisement and monitoring and to tutoring. In addition, referrals and advocacy are provided. The department oversees the following academic support offices and services: Freshman Programs, Academic Advisement Center (AAC), the General Studies Program, the Higher Education Opportunity Program (HEOP), the Office of Academic Affairs, the Office of Special Services—TRIO Program and the Polytechnic Tutoring Center (PTC).

For more information about the department, visit www.poly.edu/academics/support.

Freshman Programs

The Institute is committed to improving the persistence and performance of first-year students by helping them to acclimate to their academic discipline, its associative culture and student life. The office is the primary contact for first-year student issues and offers diverse and dynamic collaborative efforts with constituencies across the campus community. These partnerships provide a great sense of cohesion to the programs and services that meet the needs of first-year students. Programs and services offered include first-year advisement, faculty-student mentoring, early alert and academic probation initiatives, first-year instructors meetings and parent outreach. (See Section on “Programs and Services for the First-Year Students” for an expanded description of the programs and services in this area.)

Academic Advisement Center
The mission of the Academic Advisement Center (AAC) is to provide centralized advising for all incoming, matriculated first-year students. The staff advises students on major requirements and Institute regulations and refers them to campus resources. In addition, academic advisers advocate for students with Polytechnic offices and help students deal with issues affecting them. Students are assigned advisers in their major departments after the first year.

Students may make an appointment or drop in to see their adviser. Advisement sessions cover an array of topics, including major requirements, Institute regulations and life-skills development. The center refers students to campus resources for additional support and guidance in an effort to address any Institute-related issues affecting them. In addition, academic advisers advocate for first-year students with the offices of the Registrar, Financial Aid, Student Accounts and Admissions, as well as other offices.

In conjunction with the Office of Academic Affairs, the center directs the review of first-year students’ progress to determine academic standing. The academic advisers make decisions on eligibility for the Dean’s List, academic probation and disqualification of first-year students and notify them of their academic standing. Students on probation are directed to meet regularly with their advisers to discuss their situation and learn how to make improvements to return to good academic standing. All first-year, first-time probationary students must enroll in and attend SL 1020, Academic Skills Seminar.

For more information about the center, visit www.poly.edu/academics/support/academic.

**General Studies Program**

The General Studies (GS) Program provides proactive support for students, allowing them an opportunity to matriculate and successfully obtain a science-, engineering, humanities- and management-based education. To ensure student success, General Studies students receive a broad variety of services, beginning with a mandatory summer program before the start of their freshman year and continuing throughout the academic year with mandatory, weekly tutoring and advisement sessions. Once admitted into Polytechnic, students must successfully participate in the program for one year before they are allowed to officially declare their major. Advanced Placement (AP) and transfer credits may not be used toward the completion of GS Program requirements. For additional information, please refer to “Special Programs,” in this catalog or visit www.poly.edu/general-studies.

**Higher Education Opportunity Program (HEOP)**

The Higher Education Opportunity Program (HEOP) is a New York State-funded program that provides broad and varied educational instruction to capable students who, because of limited academic and financial resources, might otherwise not have the opportunity to attend Polytechnic. Once admitted to the HEOP program, students receive financial assistance, counseling, tutoring, advisement and other support services during their college career. HEOP’s goal is to retain and graduate students who are traditionally underrepresented in engineering and science. More information on HEOP is included in “Special Programs,” in this catalog or, visit www.poly.edu/academics/support/heop.

**Office of Academic Affairs**

The office reviews all undergraduate students’ progress each semester to determine academic standing. Decisions are made on eligibility for the Dean’s List, academic probation, disqualification and appeals of academic disqualifications. Notifications for all academic actions are e-mailed to students and their academic departments and Institute support offices.

This office also coordinates evaluations of transfer credits in cooperation with the Office of Admissions and academic departments. The Office of Academic Affairs also serves as liaison between the Office of Undergraduate Academics and undergraduate advisers to ensure uniformity of advising practices. The staff also assists the Dean with articulation agreements with other universities.
Office of Special Services - Trio Program

The Office of Special Services is a federally funded TRIO program that provides a wide range of support services to low-income, first-generation college students and students with disabilities. The mission of the Office of Special Services-TRIO program is to enhance the likelihood that students accepted into the program will successfully complete the academic programs at the Institute.

The TRIO program provides eligible students with a variety of free and confidential tutoring, academic counseling and other support services to enhance students' academic performance and maximize their potential, including:

**Individualized Tutoring**

The office staff assigns qualified upper-classmen to tutor students one-on-one in physics, math, biology, chemistry and computer science. Students meet weekly throughout the semester with an assigned tutor, who addresses their individual concerns about the course. Small-group review sessions in upper-level courses are also scheduled for students throughout the semester and a variety of study aids, instructional software and other resources are available to participating students.

**Academic Counseling**

Academic counseling is available to help students manage the academic challenges of Institute life. The office offers individualized study-skills advisement and workshops on various topics, including goal setting, time management and test taking. These academically related skills assist students to master the technical curriculum at Polytechnic. The office also provides career guidance and testing and arranges on-site visits and tours to help students explore opportunities when they graduate.

**Social Integration Activities**

The program schedules cultural and educational workshops and trips throughout the academic year to help students acclimate to the Institute and develop peer support networks.

**Financial Assistance**

The program provides eligible students with financial assistance through grants and scholarships.

For more information about the Office of Special Services-TRIO Program, visit www.poly.edu/academics/support/trio.

**Polytechnic Tutoring Center (PTC)**

The Polytechnic Tutoring Center (PTC) offers a range of academic support services to all registered Polytechnic students. Tutoring is offered for the biology, chemistry, computer science and physics courses for first- and second-year students. Tutoring is provided on a drop-in basis as well as through exam-review sessions.

The PTC also includes the Writing Center, where students receive help with college-level writing, reading and speaking assignments and with English-language mastery. The Writing Center is open to Polytechnic students at any level, from first-year undergraduates through doctoral candidates. Writing Center staff work with students individually and in small groups.

Tutors are carefully selected and trained. They include undergraduate peer tutors, graduate students and instructors. Tutors know their subjects well and understand where students may have difficulty. They are skilled at explaining material in a variety of ways
for maximum comprehension. All students’ questions are respected; no question is too basic to ask. The PTC also helps students improve their learning skills in order to become more successful in college and throughout their careers.

PTC services are free of charge. For more information about the center, visit www.poly.edu/academics/support/polytechnic.

Registration

During registration, students meet with their academic adviser who gives them academic advisement and approves their choice of courses. Students then register themselves online via Student Self-Service and pay tuition and fees to the Office of Student Accounts, all according to published deadlines. To receive academic credit, students are required to register each semester for every course, including theses, projects and guided studies. Class attendance without registration is not permitted.

Advisement for Registration

The academic advising process is the basis for student course selection and registration. Each academic department identifies faculty or professionals who serve as advisers to the students. Before registration, students must meet with their adviser and receive approval for their anticipated program of study. Students may obtain a list of advisers and their contact information from their respective departmental offices.

To ensure that students have met with their academic advisers before registration, the Registrar places an “academic hold” on the student’s record. When students meet with their advisers, the holds are removed and students can register.

Approval to register for a course does not necessarily constitute approval to substitute that course for another course to satisfy a specific degree requirement. For example, approval to register for a guided readings course is not necessarily approval to substitute that course for another similar course prescribed in the curriculum. If the course is not normally used for that purpose, students should explicitly request such approval from the adviser. Such approval must be granted in writing and submitted to the Office of the Registrar.

Incoming first-year students may be required to take a mathematics diagnostic and/or English placement exam. These exams are free and used solely for advisement and course placement.

Registering for Classes

Polytechnic offers two registration periods for each semester (detailed below). New freshmen entering in the fall semester register during the summer preceding their arrival on campus. New students and special students receive registration information from the Office of Undergraduate Admissions or the Graduate Center.

Regular Registration

All continuing, degree-seeking students (graduate and undergraduate) are expected to register for the next semester during the latter part of each ongoing semester. All students must take advantage of regular registration using Student Self-Service, the student online registration system. All students are encouraged to enroll early in the registration period to avoid being closed out of required courses. Registration dates for each semester are published by the Office of the Registrar. Payment of tuition and fees, or arrangement for payment, is due to the Office of Student Accounts no later than the published deadline.

Late Registration and Add/Drop
The Late Registration and Add/Drop period begins on the first day of the term and ends on the published Add/Drop Deadline. A late fee is assessed to all continuing students who initially register during this period. Since Late Registration typically takes place after the tuition payment deadline, payment of tuition and fees is therefore due on the same day as registration during the Late Registration period. Students who do not complete registration by the end of the Late Registration and Add/Drop period will not be registered for that semester. After the Add/Drop Deadline, students seeking to register need to obtain special permission from the respective Associate Provost in addition to the course instructor(s). Such exceptions are rarely permitted, and must be submitted to the Office of the Registrar with the appropriate paperwork and signature approvals. A late fee will be assessed to all continuing and readmitted students for late registrations.

Additions or deletions to a student course schedule may be made according to the deadlines published in the Academic Calendar. These adjustments should be made online through Student Self-Service. A course dropped after the Add/Drop deadline is considered a Withdrawal, and such courses will remain on the student’s transcript with a grade of “W” (which has no GPA penalty). Withdrawals should also be processed by the student online via Student Self-Service.

If a student drops or withdraws from a course, tuition charges are adjusted according to the Refund/Tuition Liability schedule published by Student Accounts.

Special Programs

- Higher Education Opportunity Program (HEOP)
- Honors Program
- Center for K-12 Stem Education

Student Services

Career Management Center

The Career Management Center and the NYU Wasserman Center for Career Development will connect you with leading companies that are searching for highly skilled, market-ready individuals prepared to take on the challenges and opportunities of the 21st century. Our offices help undergraduate and graduate students seek positions where their refined technical, analytical and communication skills can best be put to use.

Career Counseling and Career Development Seminars

Knowing how to conduct an internship or job search is key to landing the opportunity you want. Through one-on-one career counseling and group seminars, NYU-Poly students acquire effective job search skills designed to complement their successful in-classroom experiences. Writing an effective resume, preparing for a career fair and acing the interview are just some of the topics addressed by career center staff.

Internship Opportunities

Internships allow students to gain real-world experience, while giving employers a chance to identify future talent. Students are encouraged to participate in one or more internships before they graduate, demonstrating to employers NYU-Poly’s high standards of excellence. These professional experiences give students an edge over the competition and have the potential to turn into full-time opportunities following graduation.
NYU Careernet, Career Fairs and On-Campus Recruiting

NYU-Poly students can connect to NYU CareerNet, our online internship and job search engine. Using this valuable database, students can submit a cover letter and resume directly to employers. Additionally, internship and job seekers can meet with hiring companies at career fairs and even arrange on-campus interviews with these employers. Participating companies range from small entrepreneurial start-ups to mid-sized businesses to internationally recognized major corporations.

Counseling and Psychological Services (CAPS)

“Helping Students Achieve Maximum Potential”

CAPS offers free, confidential psychological services to all NYU-Poly students. College can be a stressful time, and students can face a range of difficulties that can interfere with their ability to succeed academically or function at their best. For example, many students struggle with concentration, test anxiety, sadness, lack of motivation and difficulties with family or friends that can interfere with their NYU-Poly experience. The CAPS staff is available to meet with students and help resolve these issues. Staff members provide information and support to help students solve problems, achieve goals and feel better.

Students can make an appointment by calling (718) 260-3456, emailing counseling@poly.edu or dropping by the center.

CAPS is open Monday through Friday, 9 a.m. to 5 p.m.

Throughout the year, CAPS offers workshops on meditation, stress reduction, relationships and getting a good night’s sleep. Workshops are advertised on the CAPS website, in the Polytechnic calendar, and through campus e-mail blasts.

For more information about CAPS and its services, visit www.poly.edu/life/health/counseling. On the site, students also can link to a variety of online screenings to anonymously answer questions to determine whether they (or a fellow student) show signs of common mental-health problems like depression, anxiety, substance abuse or posttraumatic stress.

Updated information on participation in NYU-sponsored activities and services is available on the website.

International Students and Scholars

Graduate and undergraduate international students come from more than 60 countries, make up 40 percent of the student body and are an integral part of the NYU Poly community. All new international students and visiting scholars (researchers and faculty) are required to report with immigration documents, including I-20s, DS-2019s and passports, to the Office of International Students and Scholars (OISS) immediately upon arrival. In addition, all new students and scholars must attend a mandatory orientation held at the start of every semester.

The office provides information and counseling regarding immigration compliance, travel, employment, acculturation, housing, health insurance and special events. International students, researchers and faculty may contact the office in person or by telephone, and are encouraged to attend on-site workshops offered at designated times during the academic year. All international students, research scholars and faculty are required to carry health insurance.

For additional information on admissions and academic requirements, please consult those sections dealing with undergraduate and graduate admissions and academic programs and policies.

Study Abroad

The opportunity to study abroad provides students a chance to experience life in countries rich in history, culture and accomplishment. Immersion experience in another culture strengthens understanding of the world and appreciation of
international contribution to knowledge. It offers an opportunity to learn how to cope in international environment and communicate across barriers of language, custom, geography and politics. Skills developed during this experience add an invaluable dimension to the quality of a well-rounded education that ultimately enhances professional and personal endeavors in the developing global community.

Students may apply for short-term study, a semester, or a full academic year abroad. Students may select from one of 50 institutions around the world with which Polytechnic has direct-exchange agreements, as well as NYU Study Abroad sites.

Participation in the study-abroad program is open to undergraduate and graduate students. Undergraduate students are eligible after one year of academic study so long as they maintain a 2.5 GPA. While these are the minimum Polytechnic requirements to participate in the program, host institutions will make their own determinations about admissibility.

Academic credits earned during study abroad are transferable to Polytechnic and may be applied to degree requirements subject to institute policies and the approval of the student’s major department. For additional information contact OISS.

**Programs and Services for the First-Year Students**

**Freshman Programs**

The Institute is committed to improving the persistence and performance of first-year students by helping them to acclimate to their intended academic discipline, its associative culture and student life at Polytechnic. Achieving this goal requires diverse and dynamic collaborative efforts with constituencies across the campus community. These systemic partnerships yield a greater sense of cohesion to the programs and services for first-year students.

Programs and services in this area include first-year advisement, faculty-student mentoring, early alert and academic probation initiatives, first-year instructors meetings and parent outreach.

**Academic Advising Center**

The mission of the Academic Advisement Center (AAC) is to provide centralized advising for incoming, matriculated first-year students. The staff advises students on major requirements and Institute regulations and refers them to campus resources. In addition, academic advisers advocate for students with Polytechnic offices and help students deal with issues. The ultimate goal of the AAC is to empower students to make informed decisions about their academic careers.

**Faculty-Student Mentoring**

The purpose of the mentoring program is to provide first-year students with the academic capital needed to acclimate to the academic community, their intended major and future profession. Early and continuing contact with faculty allows students to form mutually beneficial relationships with faculty members during their first year of college. Understanding how to partner with faculty members is a skill that benefits students throughout their academic careers.

Benefits of the mentoring program for first-year students extend beyond connecting with faculty members at an earlier stage in their academic career.

Additional benefits include:

- Increased likelihood of persisting beyond the first year;
- Increased understanding of the intended major;
- Increased satisfaction with the college experience; and
Improved communication and interpersonal skills.

Benefits experienced by the faculty include:

- Deeper understanding of the collective and individual concerns of first-year students;
- Increased visibility among the first-year students; and
- Improved access to and contact with students outside the classroom.

**Early Alert and Academic Probation**

Each semester requests are sent to first-year instructors asking for feedback on their students’ academic progress. Students at risk of not passing their course(s), based on their current progress, are notified of their academic status and encouraged to meet with their instructor(s) and academic advisor to remedy the situation. At these meetings, students have the opportunity to think critically about the behaviors contributing to their status, while being invited to take advantage of the various support services to help them maximize their academic experiences.

All first-year, first-time probationary students must register for and pass SL 1020 Academic Skills Seminar. The course consists of eight one-hour sessions, which meet once a week, and is taught on a pass/fail basis. The seminar helps students learn to become more academically successful. The “Academic Probation” section of the catalog contains more information about this course.

**First-Year Instructors**

A meeting is held once a semester with a cross-section of the instructors teaching first-year courses and staff members from the academic support offices. These meetings inform participants of recent curriculum and instructional changes, academic policy updates and any modifications to the cadre of services offered by the academic support programs. In addition, these meetings act as a “pulse check” of the issues first-year students are encountering and how these challenges are expressed in academic and communal parts of the Institute.

**Parent Outreach**

Educating parents on the academic experiences of first-year students is a critical step in forming an effective partnership between the Institute and family members. Parents Meetings are hosted each semester, providing family members with an opportunity to speak directly with faculty, administrators and students about the majors and support services available to students.

**New Student Orientation**

Polytechnic seeks to ease new students’ transition to their new educational environment with a variety of programs that orient and welcome new students every semester. These programs are housed under the New Student Orientation (NSO) umbrella, and are a result of the collaborative efforts between Student and Academic Affairs. NSO programming covers a broad array of topics that not only help students gain a better understanding of student life in academic and social spaces, but also signals to the Institute the arrival of the newest members to the community.

**Residence Life**

A residence-life program is an integral part of college life and can greatly enhance students’ college experience. Resident students become members of a supportive peer community in an academic environment that offers opportunities to fully develop academically and socially. Residence life helps students develop personal responsibility as it supports them in meeting their
academic goals. The Polytechnic Institute of NYU is committed to providing safe and affordable housing for students interested in a residence-life experience.

Campus housing is available for all students. NYU-Poly does not provide housing for students' families. Inquiries about campus housing should be made to the Office of Residence Life at (718) 260-4160.

**Campus Housing Facility**

On the Brooklyn campus, the Donald F. and Mildred Topp Othmer Residence Hall is a 20-story building that houses more than 400 students in two-bedroom suites and two-bedroom apartments with kitchenettes. Each room has Internet and cable TV ports. This innovative building is wireless and includes student lounges, study rooms, laundry facilities, outdoor space and 24-hour security. Two full-time professional residence-life staff members work with graduate and undergraduate student resident assistants and security personnel.

The Clark Residence is connected to the St. George Residence - Weller Building and Studio Building - and occupies the site of the former St. George Hotel in one of New York City's most desirable neighborhoods, Brooklyn Heights. Just one subway stop from lower Manhattan, the Clark Residence is within walking distance to NYU-Poly’s MetroTech campus, shopping, dining on Montague Street and a short walk to the Brooklyn Promenade, home to breathtaking views of the Manhattan skyline.

Each single, double and triple fully-furnished room in the Clark Residence offers a TV, DVD player, high-speed internet, refrigerator, microwave and bathroom. The residence features lounges, a pool table, public computers, communal kitchens and a complimentary membership to the four-star Eastern Athletic Club.

**Campus Housing Requirements**

All students living on-campus are required to be full-time NYU-Poly students and Othmer residents are required to be on the Institute meal plan. For security purposes, all resident students are mandated to have a cell phone and sign-up for the Emergency Text Alert system (E2campus).

**Student Development: Activities, Advocacy, Leadership**

**Department of Student Development**

The Department of Student Development is a part of the Division of Student Affairs and is concerned with the holistic education and development of all Polytechnic students, inside and outside the classroom. The department helps students to assemble their educational, personal and professional development puzzle—from orientation to commencement. Student Development provides a variety of programs and support that enhance the first-year student transition, develop student leadership excellence, promote campus community citizenship, foster campus-wide diversity awareness and provide general student advocacy.

**New Student Programs**

NYU-Poly seeks to ease the transition for students into their new environment with a variety of programs designed to orient and welcome new students. These programs are generally held before the fall and spring semesters.

**New Student Orientation (NSO)**
Orientation is designed with a variety of offices throughout the Institute and student Orientation Leaders to welcome all new students to the Polytechnic community and to introduce them to the various campus offices, programs and resources that lead to student success.

New Student Orientation introduces new students to the NYU-Poly community and offers opportunities for incoming first-year and transfer students to complete their enrollment activities well before classes begin. Students will receive the information and tools needed to successfully acclimate to the NYU-Poly environment and become an active member of the academic community. Orientation programs are designed around the objectives of familiarizing students with their intended major; increasing understanding of the first-year curriculum and its connection to the academic discipline; and familiarizing new students with critical on-campus first-year support networks.

The overall goal is to create a sense of excitement and enthusiasm around the students’ majors, while demystifying preconceived notions about majors and college life. The program is coordinated by a team of administrators, faculty and students who welcome new students to the NYU-Poly community.

**New Student Convocation**

New Student Convocation is the first major academic program new students experience as members of the Polytechnic community. At convocation, new students are inducted into the NYU-Poly academic community and pledge to abide by the Institute Code of Conduct, refrain from academic dishonesty, respect intellectual property, participate actively in their education and uphold the exemplary reputation of the NYU-Poly alumni.

**New Student Camp Experience (NSCE)**

All new first-year and transfer students are invited to attend an overnight trip to a campsite in upstate New York. The New Student Camp Experience (NSCE) is offered during the week before classes begin and helps new students make friends, become comfortable with their new classmates and meet some key administrators and student leaders who will be vital to their success at NYU-Poly. The NSCE is considered one of the most memorable highlights of the NYU-Poly experience.

**Services for Students with Disabilities**

Polytechnic Institute of NYU supports Section 504 of the Rehabilitation Act of 1973 and the Americans with Disabilities Act. In this regard, it makes every effort to provide full and barrier-free program accessibility.

NYU-Poly is committed to assisting students with disabilities in developing the personal and academic skills necessary to participate fully in student programs. To that end, services are provided to students with disabilities based on individual needs. The Institute is particularly interested in helping students to become effective self-advocates.

Accommodations for students with disabilities do not include the waiving of academic course requirements.

Students with disabilities are encouraged to register with the Department of Student Development whether or not services are requested. If necessary, students can request services by meeting with Student Development staff and submitting supporting documentation. Visit the NYU-Poly web site at www.poly.edu/disabilities for more details.

**Student Activities and Leadership Development**

Student activities are an integral part of the educational process. Participation in student activities fosters the development of leadership and interpersonal skills. NYU-Poly believes that student activities broaden the academic experience. The Institute encourages every student to take part actively in co- and extracurricular student activities, which promote and produce a balanced educational experience. The NYU-Poly website offers updated information on participation in NYU-sponsored activities and services.
Student Council

The Student Council is the undergraduate student voice and governing body at NYU-Poly. The Council is the umbrella organization for all student clubs and organizations. It is responsible for administering student activities fees, social and cultural programming and other co- and extracurricular activities.

Student Clubs, Organizations and Fraternities

There are more than 45 student organizations, honors societies and fraternities at NYU-Poly. Each group is responsible for fulfilling the purposes of the organization as set forth in its constitution, charter or business plan. Student organization documents are filed with the Office of Student Activities and the Student Council. New groups and organizations can be created by complying with the procedures set by the Student Council. The Student Council and Department of Student Development publish a list of student organizations at the beginning of each academic year.

Professional and technical societies are established in conjunction with various academic departments to enhance the curricula at NYU-Poly. These student chapters are branches of national parent organizations. In chapter meetings, members hear distinguished guest speakers, plan field trips, read professional papers and work on technical projects. As a part of the clubs and organization framework under the auspices of the Student Council, these chapters are funded, in part, by student activities fees.

NYU-Poly has student organizations to suit almost every interest, whether social, intellectual, religious, musical, cultural or athletic. Many of the organizations have long and distinguished histories.

NYU-Poly has four social and service fraternities. These organizations hold an impressive array of social functions for their members and serve the NYU-Poly community through blood donation drives, annual charity drives, athletic tournaments, parties and more.

For a listing of current student clubs and organizations and fraternities, visit www.poly.edu/life/clubs/student.

Orientation Leader Program

The Orientation Leader Program is comprised of upper-level, enthusiastic student volunteers who want to share their love of NYU-Poly with new students. Orientation Leaders (OLs) are selected during the spring semester and train to run new student orientation programs (include the New Student Camp Experience—NSCE). More information about the OL Program can be found at www.poly.edu/life/student/leadership.

Peer Counselor Program

The Peer Counselor Team is a group of upper-level students who assist first-year students in making the transition from high school to college. The program includes extensive leadership training during summer months with in-service training throughout the academic year. The Peer Counselor interview and selection process occurs early each spring semester for the following academic year. More information about the Peer Counselor Program can be found at www.poly.edu/peer-counselors.

Other Programs

The Student Development also coordinates or assists with other programs such as health fairs, graduation fairs, the annual Poly Pride Day celebration, Commencement and the Commencement and Achievement Awards Ceremony.

Student Advocacy
The Department of Student Development plays a vital role in supporting and encouraging students who are faced with challenging situations during their student careers. It is one of several places where students can get confidential help. As student advocates, the staff of the Department of Student Development works with various other offices to help students solve problems and develop self-advocacy skills.

Absence Notification to Faculty

It is important for instructors to know when students are experiencing difficulty that might interfere with their studies. However, it is also important that student personal issues be kept confidential. Therefore, Student Development is designated to receive documentation regarding private matters. Documentation is required for an official verification notice to be sent to instructors. The notice informs the instructor that necessary documentation has been received but does not disclose personal details. Notification can be provided for the following extenuating circumstances: death in the family, medical conditions and illnesses, other emergencies and situations, and representing the NYU-Poly at conferences.

Student Grievances and Complaints

Student Development is one of the offices where student grievances and complaints are heard and action is taken on behalf of students.

Student Misconduct and Academic Dishonesty

Incidents of student misconduct and academic dishonesty are reported to Student Development for review and action according to the Institute Code of Conduct and other Institute policies.

The Institute Code of Conduct, edited and administered by the Department of Student Development, gives notice to the NYU-Poly community of prohibited behavior and outlines the procedures to be followed in the event of a breach of this code. This Code protects and promotes the academic enterprise and is indispensable in maintaining an academic environment conducive to teaching, learning and the development of individuals.

The Institute Code of Conduct is available to students and all members of the Polytechnic community at www.poly.edu/academics/code-of-conduct. For further information, contact Student Development at (718) 260-3800.

Index of HEGIS Codes

Degrees Offered at Polytechnic

Polytechnic offers a wide range of degree programs leading to the degrees Bachelor of Science, Master of Science, Master of Engineering and Doctor of Philosophy. These programs are offered at four Institute locations: Brooklyn, Long Island, Manhattan and Westchester and online at ePoly. In addition, a MS in Management is offered in Israel. The table below indicates the degrees registered at each campus. Please check with each department to confirm that a program is currently available at the locations indicated below. Graduate courses taken at any campus are applicable toward MS and PhD degree programs officially offered at another campus.

Most graduate courses are offered in the evening or late afternoon. While PhD seminars, qualifying exams, etc., are available only on the Brooklyn campus, dissertation research may be at another campus where the faculty adviser is resident.

Center for K-12 Stem Education

The Center was launched in March 2011 and represents a new approach to early grade and pre-college science, technology, engineering and mathematics (STEM) teaching and learning at the Polytechnic Institute of NYU. The Center builds on several very strong programs already at NYU-Poly that improve student outcomes; these programs provide high-quality professional development in STEM disciplines to K-12 science and mathematics teachers. NYU-Poly's programs further mentor teachers and K-12 students in STEM disciplines through NYU-Poly's human resources of faculty, administrators and students, its physical resources of laboratories and classrooms and Institute initiatives that expose young people to the creative, exciting and academically challenging world of science.

Students that participate in NYU-Poly's K-12 programs gain analytical skills and knowledge by engaging in scientific inquiry, an excitement about the personal possibilities educational attainment provides and a deep appreciation for the inherent creativity embedded in all kinds of scientific and academic pursuits. Achieving these goals puts students on the path to school completion, higher education and economic and social advancement.

While focused on those groups of students traditionally underrepresented in STEM disciplines and careers and those who teach those students, the Center has a broad reach throughout K-12 schools and systems. The Center's overall objective - to transfer STEM knowledge and the excitement inherent in the pursuit of scientific discovery and innovation from NYU-Poly's faculty and students to K-12 teachers and learners - is met in a variety of settings and through a diversity of means designed to instill inspiration and motivation.

Drawing heavily on the i2e principle guiding the Institute's growth and development, the Center for K-12 STEM Education creates, pilots, evaluates and scale models programs that advance student learning. It seeks not only to incorporate invention, innovation and entrepreneurship in its K-12 STEM education models, but also incorporates these values in the Center itself. The Center is designed to be entrepreneurial in creating and seizing opportunities, engaging interested people in its work, and is organized to be flexible, responsive, transparent and accountable for results. It is strategic in its decision-making, has the confidence to make mistakes and test ideas and is nimble enough to change models as evidence and data dictate.

There are many existing models and involved faculty and students at NYU-Poly, as well as elsewhere throughout the nation, upon which the Center for K-12 STEM Education is grounded. The Youth in Engineering and Science (YES) Center as well as the work of the former David Packard Center will combine with the Center's model programs which will reside at the nexus of hands-on-science, evidence-based practice in teaching and learning, and research that enhance the field of K-12 STEM education. Working with faculty, the Center develops and reengineers initiatives to enhance the K-12 experience such as summer research opportunities, sophisticated professional development models for K-12 teachers, in-depth engagement with science and scientists for students in classroom and after-school settings, the use of technology in STEM education and others yet to be conceived.
Higher Education Opportunity Program (HEOP)

The Higher Education Opportunity Program (HEOP) is funded by New York State to provide broad and varied educational instruction to capable students who, due to limited academic and financial resources, might otherwise not have the opportunity to attend NYU-Poly. Once admitted to the HEOP program, students receive financial assistance, counseling, tutoring, advisement and other support services throughout their college career. HEOP’s goal is to retain and graduate students who are traditionally underrepresented in engineering and science.

Admission and Application Procedures

To qualify for the program, applicants must be residents of New York State and demonstrate both academic and economic need. Applicants are referred by an admissions counselor, or may indicate on their application their interest in HEOP. Economic eligibility is determined by income guidelines issued by the New York State Education Department.

Since SAT scores and high school grades may not thoroughly reflect a student’s potential for success at NYU-Poly, an interview with each applicant is an essential part of the HEOP admissions process. During the interview, the counselor will discuss the applicant’s academic strengths and weaknesses and give a basic overview of what to expect at NYU-Poly.

Transfer Students

Students wishing to transfer into HEOP at NYU-Poly must have been in an opportunity program (HEOP, EOP, SEEK, etc.) at their previous institution. Each applicant must also complete a HEOP transfer application. Transfer applicants are considered based on their academics and individual circumstances. The HEOP Director reviews college transcript(s) and recommendations from counselors or professors, and a decision is sent to the Office of Admissions.

Academic Support Services

To help students reach their full academic potential and succeed at NYU-Poly, HEOP provides freshmen and continuing students with academic support services.

These services include the following:

- A mandatory pre-freshman summer program, which includes courses in Pre-Calculus, Chemistry, Computer Science and Physics.
- A Study Skills course offered during the fall semester. Topics include time management, test-taking, note-taking and concentration techniques.
- Monthly group meetings and seminars.
- Individual and group tutoring sessions.
- Individual and group counseling.

Counseling

HEOP offers students one-on-one academic, financial, personal and career counseling. Group and individual counseling sessions are scheduled to assist students make the transition to college, as well as to maintain and manage their academic career at NYU-Poly.
Financial Aid

HEOP students receive a financial aid package, including funding from HEOP, Tuition Assistance Program (TAP), PELL, Supplemental Educational Opportunity Grant (SEOG), NYU-Poly grants, College Work Study Program, Stafford Loans and other educational loans. It is important that students complete the Free Application for Student Aid (FAFSA) and the Tuition Assistant Program (TAP) applications as early as possible.

For further information, please visit the HEOP website at www.poly.edu/academics/support/heop, or call (718) 260-3370.

Honors Program

The NYU-Poly Honors Program offers students of exceptional promise and talent an enriched educational experience that extends beyond the traditional classroom environment. Learning takes place in a collaborative manner, where students are encouraged to critically reflect on their coursework by dialoging with the various constituencies at the Institute. The program offers a superior educational experience by fostering critical thinking and creativity. The program’s depth and breadth are comprehensive, rigorous and individualized. Students will enroll in honors courses taught by outstanding faculty and engage in undergraduate research and benefit from presentations by renowned faculty, inventors, innovators and entrepreneurs.

Rigorous intellectual development through active learning and faculty mentoring combine with an interdisciplinary focus and global awareness that prepares students to become leaders in engineering, science, technology and entrepreneurship. As rising scholars, Honors students are a highly enthusiastic and prominent part of the University's alumni population and enhance the overall reputation of the University for delivering excellence in education. As such, Honors Program students are awarded an additional scholarship.

Admission and Application Procedures

The Honors Program has a referral-only admissions process. Selected individuals who are admitted to NYU-Poly as first-year students will be referred to the Honors Program by the Admissions Office. Those students referred to the Honors Program will then be asked to complete a short application and personal statement. Applications are reviewed by the Honors Program Admissions Committee. Preference is given to students with outstanding high school GPA and SAT scores; however, files are reviewed in a comprehensive manner and other important criteria are given serious consideration. Among these are the difficulty of course work (AP courses), written submissions such as the personal statement, receipt of prizes and awards, leadership positions, participation in academic clubs, and evidence of self-discipline and persistence as confirmed in the letters of recommendation. Some applicants will be asked to participate in an interview with a member of the Honors Program Admissions Committee.

Students who were not referred to the Honors Program during their initial application to NYU-Poly are not eligible for the Honors Program; there is no transferring into the program. Additionally, transfer students are not eligible for the Honors Program.

Requirements

Students admitted to the Honors Program are required to satisfy the following requirements to remain in the program and to retain the honors portion of their scholarship:

1. Enroll in required honors-level courses for their degree. Under rare circumstances and subject to approval by the Honors Program director, students may enroll in a nonhonors section of a course such as when the honors section of a course is not offered, or when an honors section conflicts with a departmental required course.
2. Maintain a minimum required cumulative Grade Point Average (GPA) each academic year as follows:
• *Freshman - 3.5
• *Sophomore - 3.5
• *Junior - 3.4
• *Senior - 3.4

3. Earn the following specified amounts of credits by the end of each academic year:
   • *Freshman - 32
   • *Sophomore - 64
   • *Junior - 96
   • *Senior - 128

At the end of each semester, the Honors Program will review each student’s academic record. If the student’s cumulative GPA and/or credit amount is below the minimum required as outlined above, the student is placed on one-semester probation to improve their academic standing. If the student’s cumulative GPA and/or credit amount is still below minimum requirements after the one-semester probationary period, the student will be dismissed from the Honors Program.

To graduate with the “Graduate of the Honors Program” designation,* students must fulfill the BS requirements of the Honors Program. This condition generally requires satisfactory completion of at least three credits of BS thesis in the student’s major. Students must submit a bound BS thesis to the Office of Undergraduate Academics, no later than two weeks before graduation, formatted as outlined in the document entitled: “Regulations on Format, Duplication & Publication of Reports, Theses & Dissertations,” available in the Office of Undergraduate Academics.

**Financial Aid**

Students granted admission to the Honors Program receive an Honors Scholarship, allocated in varying amounts. Students must complete the Free Application for Student Aid (FAFSA) to be eligible for other forms of financial aid.

**Courses**

Honors Program students take Honors-level courses in their first and second years. These courses cover the material of the typical courses in more breadth and depth and may include different assignments. Honors courses and special sections of courses are typically offered for the following (see the appropriate departmental sections of the catalog for course descriptions):

• CM 1004H General Chemistry for Honors Engineers
• EG 1003 Introduction to Engineering and Design
• PH 1013 Mechanics
• PH 2021 Introductory Physics Laboratory I
• PH 2023 Electricity, Magnetism and Fluids
• PH 2031 Introductory Physics Laboratory II
• PH 2033 Waves, Optics and Thermodynamics
• MA 1024 Calculus I
• MA 1124 Calculus II
• MA 2012 Elements of Linear Algebra I
• MA 2132 Ordinary Differential Equations
• MA 2112 Multivariable Calculus A
• MA 2122 Multivariable Calculus B

* Students who do not graduate from the Honors Program are still eligible to graduate with Latin Honors (*Cum Laude, Magna Cum Laude and Summa Cum Laude* designations) as outlined in the Undergraduate Academic Programs and Policies section of the catalog.
MSM Courses

Department of Applied Physics

Head: Lorcan M. Folan

Mission Statement

The NYU-Poly Department of Applied Physics is committed to providing high-quality introductory-, intermediate- and advanced-level physics courses as services to the Institute’s engineering and science departments. The major programs train new generations of physicists who apply the tools of physics to contemporary problems to benefit all. The department, collaborating closely with other departments, employs physics knowledge and techniques to enable engineering research and education, and serve as a catalyst for research in other scientific fields.

Physics: The Fundamental Science

Physics is the science devoted to the study and understanding of nature. It traces its history back to Aristotle and derives its name from the Greek words for nature and natural. Physics is often said to be the most fundamental science which deals with the constituents, properties and evolution of the entire universe, on all length and time scales. Other branches of science focus on smaller domains, but physics provides the foundation for all of them.

Contact Information

Polytechnic Institute of NYU
Six MetroTech Center
Brooklyn, NY 11201
Tel: (718) 260-3072
Fax: (718) 260-3139
E-mail: physics@poly.edu
Web: www.poly.edu/academics/departments/physics/

Degrees Offered

The department offers Physics, B.S. and Physics, M.S. degrees, and a dual major degree in Mathematics and Physics, administered in cooperation with the Department of Mathematics. Students may elect to take a minor in Physics or elect a Nuclear Sciences and Engineering Concentration or a Nuclear Sciences and Engineering Minor, administered in cooperation with the Department of Mechanical Engineering.

Faculty

Professors
Stephen Arnold, University and Thomas Potts Professor
PhD, City University of New York
*Microparticle Photophysics, Whispering Gallery Mode Biosensing, Organic Molecular Crystals*

Kurt H. Becker, Professor Dr. rer. net., Universität des Saarlandes, Saarbrücken, Germany
*Atomic, Molecular, and Chemical Physics; Plasma Physics; Development of New Experimental Techniques and Processes*

Hong-Liang Cui, Professor
PhD, Stevens Institute of Technology
*Applied physics/optics*

Erich E. Kunhardt, Professor
PhD, Polytechnic Institute of New York
*Low temperature plasma physics, device physics*

Edward L. Wolf, Professor
PhD, Cornell University
*Experimental condensed matter physics superconductivity; nanophysics and nanotechnology; electron tunneling spectroscopy*

**Associate Professor**

Lorcan M. Folan, Associate Professor, Department Head
PhD, Polytechnic University
*Spectroscopic characterization of aerosol particles; optical properties of micro-cavities; energy transfer in condensed matter; electron capture beta decay*

**Industry Professors**

Victor Y. Barinov, Industry Associate Professor
PhD, Academy of Science of the Ukraine

Valery A. Sheverev, Industry Professor, Director of Physics Laboratory Program
PhD, Leningrad State University

Vladimir I. Tsifrinovich, Industry Associate Professor
DSc, Kirensky Institute of Physics, Academy of Science, USSR

**Lecturers**

S. John DiBartolo, Lecturer
PhD, University of Virginia

David T. Mugglin, Lecturer
PhD, Lehigh University

**Instructor**

Vladimir Ostrovsky, Instructor
DSc, Kiev Institute of Physics, Academy of Science, USSR
Adjunct Faculty

Akhil Lal, Adjunct Professor
PhD, Polytechnic University

Alex Kattamis, Adjunct Assistant Professor
PhD, Princeton University

Emeritus Faculty

Deo C. Choudhury, Professor Emeritus
PhD, University of California

Hellmut J. Juretschke, Professor Emeritus
PhD, Harvard University

Department of Chemical and Biomolecular Engineering

Head: Walter Zurawsky

Faculty

Professor

Jovan Mijovic, Professor of Chemical Engineering
PhD, University of Wisconsin at Madison
Relaxation dynamics in synthetic and biological complex systems, modeling of processing of polymers

Associate Professors

Rastislav Levicky, Donald F. Othmer Associate Professor of Chemical Engineering
PhD, University of Minnesota
Biological polyelectrolytes, biosensors and bio-diagnostics

Edward N. Ziegler, Associate Professor of Chemical Engineering
PhD, Northwestern University
Kinetics and reactor design, air pollution control, fluidization

Walter Zurawsky, Department Head of Chemical and Biological Engineering, Associate Professor of Chemical Engineering
PhD, University of Illinois
Plasma polymerization, mass transfer in membranes
Assistant Professor

**Jin Ryoun Kim**, Joseph J. and Violet J. Jacobs Assistant Professor of Chemical Engineering
PhD, University of Wisconsin at Madison
*Protein engineering, structure and properties of proteins*

Research Faculty

**Leonard Stiel**, Research Professor of Chemical Engineering
PhD, Northwestern University

Faculty Emeriti

**Robert C. Ackerberg**, Professor Emeritus of Chemical Engineering
PhD, Harvard University

**Robert F. Benenati**, Professor Emeritus of Chemical Engineering
PhD, Polytechnic Institute of Brooklyn

Affiliated Faculty

**Stephen Arnold**, Institute Professor and Thomas Potts Professor of Physics
PhD, City University of New York
*Microparticle photophysics, optics*

**Bruce A. Garetz**, Professor of Physical Chemistry
PhD, Massachusetts Institute of Technology
*Laser spectroscopy, laser light scattering, non-linear optics, laser-induced nucleation and multiphoton processes*

BE 6253 Biosensors

*3 Credits* This course discusses various biosensors, which consist of bio-recognition systems, typically enzymes or binding proteins such as antibodies immobilized onto the surface of physico-chemical transducers. Immuno-sensors, which use antibodies as their biorecognition system, are also discussed. Other bio-recognition systems covered are nucleic acids, bacteria and whole tissues of higher organisms. Specific interactions between the target analyte and the complementary bio-recognition layer that undergoes a physicochemical change are ultimately detected and measured by the transducer. Various transducers, which can take many forms depending upon the parameters measured (electrochemical, optical, mass and thermal changes) are also covered.

*Prerequisite(s):* CM 1004 General Chemistry for Engineers, CM 2213 Organic Chemistry I, CM 2614 Physical Chemistry I, and CM 9413 Biochemistry I

CM 9710 Chemical Colloquium
Department of Civil and Urban Engineering

Interim Head: Lawrence Chiarelli

Mission Statement

The mission of the Department of Civil and Urban Engineering is to produce graduates capable of contributing to and advancing the practice of civil engineering and its sub-disciplines.

The Department

The Department of Civil and Urban Engineering mission involves its faculty in a wide variety of state-of-the-art research and in the development of innovative curricula for the civil engineers of the 21st century.

Research is focused on developing and implementing intelligent infrastructure-monitoring technologies, including smart materials, and optimizing infrastructure system planning, design, operation and management. Sustainability is a critical objective function and overarching theme.

Through the department’s involvement in local, regional and national issues, students are exposed to a daily laboratory of infrastructure issues and projects all around them. The department participates in four major interdisciplinary research centers: The Urban Infrastructure Institute, the Urban Utilities Institute, the Transportation Research Institute and the Urban Security Initiative. Department research covers a broad range of topics, including highway capacity and level of service, remote monitoring of infrastructure elements and use, management of urban utilities, intelligent transportation systems technologies, construction materials properties and monitoring, urban infrastructure security and construction operations.

Faculty members teach undergraduate and graduate courses. The curriculum exposes students to instructors in the forefront of their fields; men and women who frequently work on projects and topics of current interest, often within the region. The full-time faculty is augmented by excellent adjunct faculty who teach specialty courses in areas of their expertise, bringing a strong practical element to the classroom.

Programs are well-rounded and balanced. They combine all necessary theoretical elements with a strong emphasis on design and application. Graduates are well-versed in state-of-the-art techniques and develop the skills needed to become leaders in the profession. Among these skills are the ability to communicate effectively in oral and written form and the ability to understand the context of civil engineering projects in a complex society.

Civil Engineering Profession

Civil engineers are responsible for planning, designing, constructing, maintaining and operating today’s infrastructures. These areas cover a wide range of urban and regional systems and functions, including buildings, roads, bridges, airports, rail systems, dams, irrigation systems, water supply systems, environmental ecosystems and solid- and liquid-waste treatment and disposal systems and processes. The civil engineer practices in a broad and exciting field with a major impact on society in general and on its infrastructure environment in particular.

Modern civil engineering also deals with rapidly expanding information technologies. These technologies monitor, control, operate and manage complex infrastructure systems. From smart buildings to remote monitoring of transportation, water supply, sewage and other infrastructures, the modern civil engineer applies information technologies to improve the quality of the infrastructure environment.

Degree Programs

The department’s undergraduate programs deliver a broad civil-engineering background to the engineer beginning a professional career. Graduate programs allow students to specialize in particular areas or sub-disciplines and to pursue general graduate work across several different areas. The department offers the following degree and certificate programs:

**Bachelor of Science**
- Civil Engineering, B.S.
- Construction Management, B.S.

**Master of Science**
- Civil Engineering, M.S.
- Construction Management, M.S.
- Environmental Engineering, M.S.
- Environmental Science, M.S.
- Transportation Management, M.S.
- Transportation Planning and Engineering, M.S.
- Urban Systems Engineering and Management, M.S.

**Doctor of Philosophy**
- Civil Engineering, Ph.D.
- Transportation Planning and Engineering, Ph.D.

**Advanced Certificates**
- Construction Management Graduate Certificate*
- Executive Construction Management (Exec 21) Graduate Certificate
- Traffic Engineering Graduate Certificate
- Transit Management Graduate Certificate
- Transportation Planning Graduate Certificate

*Offered in conjunction with the Department of Management

**Undergraduate Minor**
- Construction Management Minor
Faculty

Professors

John C. Falcocchio, PE, Professor of Transportation Planning and Engineering, Executive Director of the Urban Intelligent Transportation Systems Center
PhD, Polytechnic Institute of Brooklyn
Travel demand forecasting, transportation system evaluation, planning and management

Fletcher H. (Bud) Griffis, PE, Professor of Civil Engineering, Construction Management Program Director, Director of Center for Construction Management Technology
PhD, Oklahoma State University
Building Information Modeling (BIM), model-based simulation, applications of operations research principles to construction, magnetic levitation (Maglev) transportation systems, dredging and dredged material disposal, infrastructure design, construction and management, engineering economics

Magued G. Iskander, PE, Professor of Civil Engineering, Coordinator of Graduate Programs in Civil Engineering
PhD, University of Texas at Austin
Foundation engineering, marine geotechnology, pile foundations, alternative foundations, geotechnical instrumentation and monitoring, transparent soils

Ian Juran, Professor of Civil Engineering, Executive Director of Urban Infrastructure Institute, Director of the Urban Utilities Center
PhD, DSc, University of Paris IV, École Nationale de Ponts et Chaussées (France)
Geotechnical engineering, soil improvement technologies, geosynthesis engineering, in-situ soil testing, urban systems engineering and management

Mohammad Karamouz, PE, Research Professor of Environmental Engineering
PhD, Purdue University
Environmental system management, surface and ground water hydrology, decision support systems (DSS), disaster management and urban water systems

Roger P. Roess, Professor of Transportation Engineering
PhD, Polytechnic Institute of Brooklyn
Highway capacity and level-of-service analysis, traffic control and operations, public transportation operations, transportation economics, engineering pedagogy

Industry Professors

Lawrence Chiarelli, PE, Esq., Department Head and Industry Professor of Construction Management, Construction Management Program Director, Associate Director of the Center for Construction Management Technology
JD, Brooklyn Law School
ME, The Cooper Union
Construction law, risk management, program and construction management; structural engineering and cost estimating

Anne Dudek Ronan, PE, Industry Professor of Civil Engineering
PhD, Stanford University
Water resources engineering, groundwater flow and transport modeling, numerical modeling uncertainty, climate adaptation

Associate Professors
Masoud Ghandehari, Associate Professor of Civil Engineering  
PhD, Northwestern University  
*Mechanics of fracture, durability of concrete structures, structural materials*

Elena S. Prassas, Associate Professor of Transportation Engineering, Director of Transportation Programs  
PhD, Polytechnic University  
*Traffic engineering, software systems and simulation for transportation applications, transportation economics, AI application*

### Industry Associate Professors

Andrew J. Bates, Industry Associate Professor of Construction Management, USAF Ret.  
PhD, Polytechnic Institute of NYU  
*Strategic planning and construction operations, risk analysis, statics*

Mohsen Hossein, Industry Associate Professor of Civil Engineering  
PhD, McGill University  
*Geotechnical engineering, environmental geotechnology, environmental impact assessment*

José M. Ulerio, Industry Associate Professor of Transportation Engineering  
MS, Polytechnic University  
*Transportation and traffic engineering; collection, handling and analysis of large-scale transportation data bases; highway capacity and quality of service analysis; travel demand forecasting; geometric design of highways*

### Lecturer

Roula Maloof, Lecturer of Civil Engineering  
PhD, Polytechnic Institute of New York  
*Non-destructive evaluation, fracture mechanics, finite element analysis, stress analysis*

### Adjunct Lecturers

#### Construction Management and Engineering

Peter Amato, Adjunct Lecturer of Civil Engineering  
MS, John Jay College  
President, Site Safety, LLC

Ralph D. Amicucci, CCIM, CPM, Adjunct Lecturer of Civil Engineering  
MS, New York University  
MBA, Iona College

Pooyan Aslani, Adjunct Lecturer of Civil Engineering  
PhD, Polytechnic University  
Resource-constrained scheduling, building information modeling (BIM), risk analysis

Anthony F. Caletka, PE, CCM, CFCC, Adjunct Lecturer of Civil Engineering  
BS, Syracuse University  
Managing Director, Capital Projects & Infrastructure, PricewaterhouseCoopers

John F. Caruso, Adjunct Lecturer of Civil Engineering  
BS, City College of New York  
Principal, John F. Caruso Consultant
Salvatore Castelli, Adjunct Lecturer of Civil Engineering
MS, Manhattan College
Project Manager, G.S. Engineering, P.C.

March W. Chadwick, AIA, LEED AP
M.Arch., Georgia Institute of Technology
Principal, M.Arch Architects

Dominick J. Fickeria, Adjunct Lecturer of Civil Engineering
MS, Manhattan College
Vice President, Director of Construction Management, URS Corp.

Robert N. Harvey, PE, Adjunct Lecturer of Civil Engineering
MS, Massachusetts Institute of Technology
Executive Director, Lower Manhattan Construction Command Center

Robert Maffia, PE, Adjunct Lecturer of Civil Engineering
MBA, Columbia University
Senior Director, Construction Management, Real Estate Development and Facilities, NYU Langone Medical Center

Michael P. Meehan, Adjunct Lecturer of Civil Engineering
MS, New York Institute of Technology
Consolidated Edison Company of New York (Ret.)

Lewis Mintzer, Adjunct Lecturer of Civil Engineering
MBA, Pace University
Director of Marketing, URS Corp.

Robert Otruba, PE, Adjunct Lecturer of Civil Engineering
BS, Syracuse University
University Director, Forensic and Litigation Consulting, FTI

Ronald J. Pennella, Adjunct Lecturer of Civil Engineering
MS, Polytechnic University
Project Executive, StructureTone Inc.

Patrick Prancl, PE, Adjunct Lecturer of Civil Engineering
PhD, City University of New York
Project Manager, El Sol Contracting and Construction Corp.

Salvador Rozenberg, RPA, Adjunct Lecturer of Civil Engineering
EMBA, University of New Haven
Principal, Transaction Maintenance Company

Joel Sciascia, Esq., Adjunct Lecturer of Civil Engineering,
JD, Fordham Law School
MS, Arizona State University, Del Webb
School of Construction General Counsel, Pavarini McGovern LLC

Jeffrey S. Seigel, Esq., Adjunct Lecturer of Civil Engineering
JD, Pace University School of Law
Director Business Development and Marketing, Pavarini/StructureTone

Jerome White, PE, Adjunct Professor of Civil Engineering
BS, Polytechnic University
President, Jerome B. White PC
James Vandezande, AIA, Adjunct Lecturer of Civil Engineering
BS, New York Institute of Technology
Senior Associate, HOK

Executive M BA Program in Construction Management

Mark A. Bloom, Esq., Adjunct Lecturer of Civil Engineering
JD, Fordham University School of Law
Partner, Arent Fox LLP

Albert DiBernardo, Adjunct Lecturer of Civil Engineering
MS, Polytechnic University
Principal, Weidlinger Associates

Peter M. Chorman, AIA, LEED AP, Adjunct Lecturer of Civil Engineering
BS, New York Institute of Technology
Vice President, Jones Lang LaSalle America's, Inc.

Joseph M. Giglio, Adjunct Professor of Civil Engineering
PhD, Northeastern University
Senior Academic Specialist; Executive Professor of General Management Northeastern University Vice-chairman, Hudson Institute

Francis J. Lombardi, PE, Adjunct Lecturer of Civil Engineering
MS, Columbia University
Chief Engineer, Port Authority of New York and New Jersey (Ret.)

John E. Osborne, Esq., Adjunct Lecturer of Civil Engineering
JD, University of South Carolina Law Center
Partner, John E. Osborne, PC

Raymond R. Savino, Adjunct Lecturer of Civil Engineering
MBA, Bernard Baruch College
Chief Financial Officer, The DeMatteis Organizations

Luis M. Tormenta, PE, Adjunct Lecturer of Civil Engineering
BCE, Manhattan College
Vice-chairman and Chief Executive Officer, LiRo Group

Louis A. Tucciarone, Adjunct Lecturer of Civil Engineering
MSCE, University of California at Berkeley
Senior Vice-President, URS Corp.

Lou Venech, Adjunct Lecturer of Civil Engineering
BA, Columbia College
General Manager, Transportation Policy & Planning, Port Authority of New York and New Jersey

Environmental and Water Resources Engineering

Raoul Cardenas Jr., Adjunct Professor of Environmental Engineering
PhD, New York University

Joon Om, Adjunct Lecturer of Civil Engineering
PhD, Polytechnic University
Sungho Yoon, Research Scientist, Adjunct Professor of Civil Engineering
PhD, Polytechnic University

Structural and Geotechnical Engineering

Walid Aboumoussa, PE, Adjunct Professor of Civil Engineering
PhD, Polytechnic Institute of NYU
Partner, Antonucci & Associates, Architects & Engineers, LLP

Weihua Jin, PE, Adjunct Professor of Civil Engineering
PhD, Columbia University
Chief Scientist, IceStone, LLC

J. Jong Lou, PE, Adjunct Professor of Civil Engineering
PhD, Northwestern University
President, J. J. Lou Associates LLPC

Sri K. Sinha, PE, Adjunct Lecturer of Civil Engineering
MS, Polytechnic University
Director of Plant Improvements and Asset Management, Lucius Pitkin Inc.

Alfonso Whu, Adjunct Lecturer of Civil Engineering
MS, Polytechnic University

Transportation and Highway Engineering

Andrew Bata, Adjunct Professor of Civil Engineering
MS, Northwestern University
New York City Transit Authority

Philip A. Habib, PE, Adjunct Professor of Transportation Engineering
PhD, Polytechnic Institute of New York
President, Philip A. Habib Associates

Michael Horodniceanu, PE, Adjunct Professor of Transportation Engineering
PhD, Polytechnic Institute of New York
President, MTA Capital Construction Company

Richard Malchow, Adjunct Professor of Transportation Engineering
MS, Union College
Vice President, Management and Budget, Urbitran Associates

Raman Patel, Adjunct Lecturer of Transportation Engineering
PhD, Polytechnic University

Genaro Sansone, Adjunct Lecturer of Transportation Engineering
MBA, Iona College
New York City Transit Authority

Faculty Emeriti

Alvin S. Goodman, PE, Professor Emeritus
PhD, New York University
Mission Statement

The Department of Computer Science and Engineering is committed to preparing undergraduate and graduate students for leadership roles in professional and research activities in the information-technology sector. The department fosters an environment that encourages lifelong learning in the Information Age. Graduates lead and grow in diverse working environments and apply the theories and skills of computer and information science to real-world problems. Toward this end, the department conducts state-of-the-art research in theoretical and applied computer science and maintains strong educational programs that emphasize breadth and depth in technical knowledge and proficiency in spoken and written communication skills. The environment encourages Invention, Innovation and Entrepreneurship (i²e).

The Department

Computers are now used in practically every area of human endeavor and are radically changing both the way people live and how they view the limits of human capabilities. Job opportunities in computer science and engineering are challenging and diverse. According to the U.S. Bureau of Labor Statistics, current job growth in computer science is among the highest of any technical profession.

NYU-Poly’s Department of Computer Science and Engineering offers programs leading to the BS, MS and PhD in Computer Science, and the MS in Information Systems Engineering and Cyber Security. The department offers joint programs with the Department of Electrical and Computer Engineering, leading to the BS and MS in Computer Engineering and the MS in Telecommunication Networks. The department also offers an advanced certificate in software engineering and cyber security.

The Department of Computer Science and Engineering is active in research in several key areas of computer science. The department’s research strengths are in these areas: Internet and Web research, which includes peer-to-peer networking; cloud services and networking; Web search, Web mining and social networks; multi-player games and online virtual worlds. Cyber security is one of the most important areas of computer science and engineering at NYU-Poly. Cyber security includes vulnerability analysis; peer-to-peer security; multimedia forensics; biometrics; watermarking and digital rights management; wireless security; steganography; fault-tolerant distributed cryptography; and usable security; graphics, visualization. Vision and image processing has revolutionized the world of technology. It includes computer graphics and visualization; computer vision; and image processing. Lastly, theoretical computer science includes data structures; computational geometry; computational learning theory and combinatorial optimization and approximation algorithms.

The faculty works closely with NYUPoly’s Center for Advanced Technology in Telecommunications (CATT) and has relationships with industries that support research and activity in their special interests.

NYU-Poly has been designated as a Center of Excellence for Information Assurance Education for research by the National Security Agency (NSA) and operates the Scholarship for Service Program (SFS) in Information Assurance.

The department provides students with a wide variety of advanced computer and software systems. These support PC and UNIX technology along with highly distributed networks. The department has four dedicated computer-science laboratories (virtual lab) for upper-level undergraduate students. They are the Software Engineering Laboratory, Parallel and Distributed Systems Laboratory, Visualization and Graphics Laboratory and Computer System and Security Integration Laboratory. Multimedia and Web-based laboratories are also available.

Degrees Offered

Bachelor of Science
- Computer Engineering, B.S.*
- Computer Science

Master of Science
- Computer Science
- Cyber Security
- Information Systems Engineering

Doctor of Philosophy
- Computer Science

Graduate Certificates
- Cyber Security
- Information Security Professional
- Information Systems Administration
- Software Engineering

* Offered in conjunction with the Department of Electrical and Computer Engineering.

Undergraduate Programs
For undergraduates, the department offers two degrees: a Bachelors of Science in Computer Science (BS CS) and a Bachelors of Science in Computer Engineering (BS CompE). The Bachelor of Science in Computer Science is a rigorous program that not only covers fundamental computer science subjects, such as object-oriented programming, computer architecture and operating systems, but also provides a number of exciting avenues for specialization including computer and online game development, cyber security, Internet/web systems and applications, bioinformatics, graphics and vision, digital media and management and entrepreneurship. Strong students can also apply to the BS/MS Program where it’s possible to earn the BS and MS in computer science at the same time.

The department jointly administers the Bachelors of Science in Computer Engineering with the Department of Electrical and Computer Engineering. It draws on the two departments’ strengths to provide a focus on computer system design with integrated understanding of computer hardware and software.

Master's Programs
The MS in Computer Science permits students to take courses either on a full-time or part-time basis. The curriculum has been designed for maximum flexibility. It includes fundamental courses in computer science as well as electives in specialized advanced courses on topics including computer and network security, distributed systems and networking, computer graphics, databases and web search technology. By electing the masters-thesis option, students may also pursue research with faculty members who are internationally recognized in their fields.

The MS in Cybersecurity is a new and highly innovative program that provides students with the critical knowledge and skills to become experts in cybersecurity, the science of protecting vital computer networks and electronic infrastructures from attacks. The program responds to the growing demand for security specialists in industry as well as government organizations. The department also offers MS degrees in Information Systems Engineering and System Integration.

**PhD Program**

The PhD program develops graduate skills in a broad range of areas as well as expertise in one or more specific areas and the ability to think critically and conduct independent research. Outstanding PhD students are advised to apply for financial aid in the form of teaching assistantships, research assistantships or partial-tuition remission.

**MS in Information Systems Engineering**

The information systems engineering program educates industry people facing the challenges and opportunities of integrating computers and communication systems. The program combines courses from electrical engineering, computer science and management; the emphasis is on information systems engineering. Polytechnic offers this program only at its Westchester campus, where courses are in executive format and classes meet every other weekend for two full days, Friday and Saturday.

**Software Engineering Certificate**

The advanced certificate in software engineering comprises a series of five graduate-level courses to give students the knowledge and skills needed to compete successfully in the software-development arena. Students who want to continue their studies can apply these courses to the MS program in computer science.

**Cyber Security Certificate**

The graduate certificate allows technical professionals to obtain key bodies of knowledge and specialization in cyber security. Students acquire an understanding of various technologies in emerging areas of security such as computer and network security, digital forensics, cryptography and biometrics. Students who want to continue their studies can apply all courses taken toward the MS program in computer science.

**Faculty**

**Professors**

**Boris Aronov,** Professor of Computer Science and Graduate Director
PhD, Courant Institute of Mathematical Sciences, New York University
*Algorithms, computational and combinatorial geometry*

**Phyllis G. Frankl,** Professor of Computer Science
PhD, New York University
*Software analysis and testing*
K. Ming Leung, Professor of Computer Science
PhD, University of Wisconsin
Scientific computing, computer simulation, neural networks

Nasir Memon, Professor of Computer Science
PhD, University of Nebraska
Data compression, image and video processing, computer security, multimedia computation and communication

Keith W. Ross, Department Head and Leonard J. Shustek Distinguished Professor of Computer Science
PhD, University of Michigan
Computer networking, Internet research, multimedia networking, stochastic modeling

Associate Professors

Yi-Jen Chiang, Associate Professor of Computer Science
PhD, Brown University
Computer graphics: out-of-core scientific visualization, isosurface extraction, surface simplification, virtual reality, air traffic control. Computer algorithms: I/O algorithms, computational geometry, graph algorithms, approximation algorithms, data structures

Lisa Hellerstein, Associate Professor of Computer Science
PhD, University of California at Berkeley
Computational learning theory, machine learning, algorithms, complexity theory, discrete mathematics

John Iacono, Associate Professor of Computer Science
PhD, Rutgers–The State University of New Jersey
Computational geometry, data structures, algorithms

Katherine Isbister, Associate Professor of Digital Media and Computer Science and Engineering
PhD, Stanford University
Social psychological and affective approaches to human computer interface, with special attention to games and other leisure and social technologies; embodied conversational agents and computer game characters

Torsten Suel, Associate Professor of Computer Science
PhD, University of Texas at Austin
Design and analysis of algorithms, database systems, parallel computation, experimental algorithmics

Joel Wein, Associate Professor of Computer Science
PhD, Massachusetts Institute of Technology
Scheduling, parallel and distributed computing, combinatorial optimization, data mining, algorithms

Edward K. Wong, Associate Professor of Computer Science
PhD, Purdue University
Computer vision, image analysis, pattern recognition, computer graphics

Nitesh Saxena, Assistant Professor of Computer Science
PhD, University of California, Irvine
Computer and network security, applied cryptography

Industry Faculty
Robert J. Flynn, Industry Professor and Director of CSE Programs—Westchester Graduate Center
PhD, Polytechnic Institute of New York
Computer architecture, operating systems

Haldun Hadimioglu, Industry Professor of Computer Science
PhD, Polytechnic University
Computer architecture, parallel processing, reconfigurable systems and application specific processors

Stuart A. Steele, Associate Department Head of Computer Science and Engineering and Industry Professor
PhD, Pennsylvania State University
Software engineering and management, programming languages

John B. Sterling, Industry Associate Professor
MS, New York University
Game programming, software development

Fred J. Strauss, Industry Associate Professor and Director of CSE programs in Melville Campus—Long Island
MS, Polytechnic Institute of New York
Software engineering, project management, distributed systems

Research Faculty

Gad M. Landau, Research Professor of Computer Science
PhD, Tel-Aviv University (Israel)
Serial and parallel algorithms for problems related to strings, computation biology, pattern recognition, communication networks

Instructors

Evan Gallagher, Instructor of Computer Science
MS, New York University

Daniel Katz-Braunschweig, Instructor of Computer Science
MS, Iona College

Faculty Emeriti

Henry Ruston, Professor Emeritus of Electrical Engineering and Computer Science
PhD, University of Michigan

Martin L. Shooman, Professor Emeritus of Electrical Engineering and Computer Science
DEE, Polytechnic Institute of Brooklyn

Richard Van Slyke, Professor Emeritus of Electrical Engineering and Computer Science
PhD, University of California at Berkeley
Combinatorial optimization especially applied to telecommunications systems, distributed optimization

Department of Electrical and Computer Engineering

Head: H. Jonathan Chao
Mission Statement

The department’s mission is to engage students who seek educational achievement as the nation enters a new age with new demands and opportunities. The goal is to provide students with a broad-based education for electrical- and computer-engineering careers. Polytechnic students gain the skills to become creative leaders in their professional careers with the passion and desire to discover, invent, innovate, apply and advance new science and technology to solve the world’s most critical problems.

The Department

Electrical and computer engineers—whose technical skills have produced innovations in telephones, electric power systems, rapid transit, radio, television, medical electronics, computers, microelectronics, the Internet and wireless communications—have contributed more to the quality of 20th-century life than any other profession. Twenty-first century engineering innovation will be equally exciting.

The Department of Electrical and Computer Engineering is well respected worldwide for its major contributions to the profession and its tradition of teaching and research excellence. Polytechnic electrical and computer engineering graduates are prominent in university faculties, industrial labs and company boardrooms, spanning the range of the electrical, electronic and information-technology industries.

The department enters the 21st century with strong teaching and research programs in the most exciting digital-age fields: the Internet, wireless communications, computers, multimedia signal processing, robotics, automatic control and electric-power generation and distribution.

In the intimate Polytechnic environment, students benefit from frequent access to faculty members and laboratories at the forefront of innovation. In the spirit of entrepreneurship, Polytechnic’s infrastructure encourages faculty and students to transfer their inventions to industry and to start their own companies.

The department hosts the Center for Advanced Technologies in Telecommunications (CATT), a New York State-sponsored research center, and the Wireless Internet Center of Advanced Technology (WICAT), a National Science Foundation Industry/University Cooperative Research Center. Together, these centers greatly strengthen the department in telecommunication networks and in wireless-communications research and education.

The Profession

The rapidly growing profession of electrical engineering has evolved from its early beginnings in electric-power generation and distribution through the development of radio, television, control and materials to computers, telecommunications and health care. In the last century, electrical engineers have created advances in power distribution, computers and communications that
have changed the world. Their inventions have made the world a smaller, safer place and allow for immediate reporting and images from distant places that make world events part of daily life.

While electrical engineering undergraduate and graduate students concentrate on areas of electrical science, graduates apply their training to diversified fields such as electronic design, bioengineering, city planning, astronautics, radio astronomy, system engineering, image processing, telemetry, the Internet, computer design, management and patent law. As students mature and realize their abilities, they may choose professional lives in engineering, government, or education.

The expertise of Polytechnic’s electrical engineering faculty covers a wide range of fields. Principal areas of teaching and research are microelectronic devices and systems; computer engineering; telecommunications; speech and image processing; electro-optics and electroacoustics; microwave engineering; wireless communications; power systems and energy conversion; plasma science and engineering; and systems and control engineering.

Additional information about electrical engineering careers can be found online at www.ieee.org/organizations/eab/student careers.htm.

 Degrees Offered

The Department of Electrical and Computer Engineering offers the following degree and certificate programs. Separate sections of this catalog present the objectives, requirements, advising resources and courses for individual programs.

 Bachelor of Science*

- Computer Engineering, B.S.**
- Electrical Engineering, B.S.
- Electrical and Computer Engineering (dual degree), B.S.

 Master of Science

- Computer Engineering, M.S.**
- Electrical Engineering, M.S.
- Electrophysics, M.S.
- Systems Engineering, M.S.
- Electrical Engineering, M.S.**

 Doctor of Philosophy

- Electrical Engineering, Ph.D.

 Graduate Certificates

- Computer Engineering Graduate Certificate**
- Image Processing Graduate Certificate
- Telecommunication Network Management Graduate Certificate
- Wireless Communication Graduate Certificate
- Power Electronics and Systems Graduate Certificate
- Power Systems Management Graduate Certificate

*Accredited by the Accreditation Board for Engineering and Technology (ABET).
**Offered in cooperation with the Department of Computer Science and Engineering.
***Offered in cooperation with the Department of Management and the Department of Computer and Science and Engineering.

 Graduate Certificate Programs
The department offers advanced certificate programs on current themes. Programs recognize students for successful completion of four graduate courses (12 credits) in areas of interest to working engineers. More details are available below in sections about related certificate programs. Courses completed for an advanced certificate apply toward a master’s degree in a related field. Students should consult the department’s graduate manual and website for the latest program list, which emphasizes current technology trends.

**Special Undergraduate Options**

The **BS/MS Option**: This program is available to exceptional undergraduate students, enabling them to earn both bachelor’s and master’s degrees in as little as four years.

Possible BS/MS combinations include BS in Electrical or Computer Engineering with a MS in Electrical Engineering, Telecommunications Networks, Computer Engineering or Computer Science.

**Electrical and Computer Engineering (dual degree), B.S.**: A student can earn a Bachelor of Science degree in Electrical and Computer Engineering by completing 142 credits.

**Minors**: Electrical Engineering Minor or Computer Engineering Minor.

**Student Organizations**

Polytechnic students may join student chapters of these professional organizations: the Institute of Electrical and Electronics Engineers (IEEE) and Eta Kappa Nu, the Electrical Engineering Honor Society.

**Speciality Labs**

The department keeps pace with dynamic advances in electrical and computer engineering by maintaining state-of-the-art laboratories for instruction and experimentation. Laboratory courses combine lectures, experiments and project work. These courses also provide students with a rich set of elective choices, opportunities to work on senior projects with faculty researchers, valuable hands-on experience to enhance and supplement material taught in lecture classes, and forums to practice their oral and written communication skills.

The Wireless Lab provides formal experiments, lectures and project work on state-of-the-art, commercial spread-spectrum wireless access systems, including bit-error rate analysis and UHF channel propagation measurements.

The Multimedia Lab offers students hands-on experience to acquire, process and transmit voice, audio, image and video signals to create multimedia documents and to configure networked multimedia applications.

The Local Area Networks Lab includes a set of weekly experiments using Linux-based terminals, Ethernet LANs, routers and bridges and associated software with which to conduct a variety of LAN/WAN experiments and projects.

The High-Speed Networking Lab, equipped with various equipment and tools, allows faculty and students to build hardware prototypes (VLSI/FPGA chips and PCB) and software test bed to demonstrate their research concepts in high-performance routers, network security and network on chip.

The VLSI Design Lab treats Very Large-Scale Integrated-circuit design, performance analysis and circuit characterization, using industry-standard VLSI CAD tools and hardware-description languages such as VHDL. Students study the design of CMOS logic, standard cells, gate arrays and mixed-signal (analog/digital) circuits.

The Electric Power Laboratory fosters education and research for undergraduate and graduate studies. Equipment includes modern data-acquisition equipment, smart-power supplies and loads, digital meters, computers, power transformers and classical
rotating machine pairs for dynamic testing and loading. In addition, static converters are available for experiments on Smart Grid and Distributed Resources, such as solar and fuel cells, wind power and variable-speed drives.

The Control/Robotics Lab provides a variety of experiments and project work focusing on feedback control, data acquisition and computer control.

The Microwave Lab treats the design, fabrication and testing of passive and active circuits and antennas using modern CAD and measurement software and hardware.

**Center for Advanced Technology in Telecommunications**

Through the New York State Center for Advanced Technology in Telecommunications (CATT), electrical and computer engineering faculty collaborate with industry in research, education and technology transfer in telecommunications and information systems. CATT is distinguished for its innovations in many fast-moving areas, including broadband networks, peer-to-peer networking, switch design and implementation, security hardware, ad-hoc wireless networks, cellular networks, wireless local area networks, software design and reliability, search engine technology, network design tools, traffic planning and capacity engineering, image and video coding and transport.

**Wireless Internet Center for Advanced Technology**

The Wireless Internet Center for Advanced Technology (WICAT) is a National Science Foundation center organized under its Industry/University Cooperative Research program. Polytechnic Institute is the lead site for WICAT, which includes sites at the University of Virginia, Auburn University and Virginia Tech. WICAT collaborates with more than 30 industry partners to overcome technical challenges and create new applications for the future Internet. In the future, the majority of devices will be mobiles that connect wirelessly. Institute research gives companies a crystal ball with a view of the future. Industry collaboration maximizes the practical value of new knowledge created at the WICAT universities.

**Faculty**

**Professors**

**Steve Arnold**, University and Thomas Potts Professor of Physics (Joint appointment with Department of Physics)
PhD, City University of New York
*Microparticle photophysics, photonic atom biosensors*

**Frank A. Cassara**, Professor of Electrical and Computer EngineeringDirector of Long Island Graduate Center
PhD, Polytechnic Institute of Brooklyn
*Electronic circuits, wireless communication systems*

**David C. Chang**, Professor of Electrical and Computer Engineering, Chancellor
PhD, Harvard University
*Electromagnetics, microwave integrated circuits*

**H. Jonathan Chao**, Professor of Electrical and Computer Engineering, Department Head
PhD, The Ohio State University
*Network security, high-performance routers, network on chip*

**Zhong-Ping Jiang**, Professor of Electrical and Computer Engineering
PhD, École des Mines de Paris (France)
*Control systems, complex networks*
Ramesh Karri, Professor of Electrical and Computer Engineering
PhD, University of California, San Diego
VLSI, CAD, computer engineering

Farshad Khorrami, Professor of Electrical and Computer Engineering
PhD, The Ohio State University
Robotics, control systems

Spencer P. Kuo, Professor of Electrical and Computer Engineering
PhD, Polytechnic Institute of Brooklyn
Plasmas and electromagnetics

I-Tai Lu, Professor of Electrical and Computer Engineering
PhD, Polytechnic Institute of Brooklyn
Electromagnetics, acoustics, wireless communication

Shivendra S. Panwar, Professor of Electrical and Computer Engineering, Director of the New York State Center for Advanced Technology in Telecommunications, Director of Wireless Internet Center for Advanced Technology
PhD, University of Massachusetts, Amherst
Communication networks

S. Unnikrishna Pillai, Professor of Electrical and Computer Engineering
PhD, University of Pennsylvania
Signal processing and communications

Yao Wang, Professor of Electrical and Computer Engineering
PhD, University of California, Santa Barbara
Image and video processing, computer vision, medical imaging

Zivan Zabar, Professor of Electrical and Computer Engineering
Sc.D., Technion - Israel Institute of Technology
Electric power systems, electric drives, power electronics

Associate Professors

Dariusz Czarkowski, Associate Professor of Electrical and Computer Engineering
PhD, University of Florida
Power electronics and systems, electric drives

Nirod K. Das, Associate Professor of Electrical and Computer Engineering
PhD, University of Massachusetts
Electromagnetics, antennas, microwave integrated circuits

Francisco de Leon, Associate Professor of Electrical and Computer Engineering
PhD, University of Toronto (Canada)
Power-system analysis, distributed generation systems, smart grid

Elza Erkip, Associate Professor of Electrical and Computer Engineering
PhD, Stanford University
Wireless communication, communication theory, information theory

Sundeep Rangan, Associate Professor of Electrical and Computer Engineering
PhD, University of California, Berkeley
Wireless communication, signal processing and estimation, information theory
Ivan W. Selesnick, Associate Professor of Electrical and Computer Engineering
PhD, Rice University
Signal processing

Peter Voltz, Associate Professor of Electrical and Computer Engineering
PhD, Polytechnic Institute of New York
Communications and signal processing

Assistant Professors

Helen Li, Assistant Professor of Electrical and Computer Engineering
PhD, Purdue University
VLSI and circuit design, computer architecture, memory technology and design, microelectronics and nanotechnology

Yong Liu, Assistant Professor of Electrical and Computer Engineering
PhD, University of Massachusetts, Amherst
Communication networks

Garrett S. Rose, Assistant Professor of Electrical and Computer Engineering
PhD, University of Virginia
VLSI, Nanoelectronics, low-power circuit design

Industry Faculty

N. Sertac Artan, Industry Assistant Professor of Electrical and Computer Engineering
PhD, Istanbul Tech. University (Turkey)
High-speed network security

Matthew Campisi, Industry Assistant Professor of Electrical and Computer Engineering
MS, Polytechnic University
Signal processing, medical imaging

Michael Knox, Industry Associate Professor of Electrical and Computer Engineering
PhD, Polytechnic University
Wireless communications, RF and microwave components, analog-circuit design

Kang Xi, Industry Assistant Professor of Electrical and Computer Engineering
PhD, Tsinghua University (China)
High-speed networking

Research Faculty

Thanasis Korakis, Research Assistant Professor
PhD, University of Thessaly (Greece)
Wireless networks

Pei Liu, Research Assistant Professor
PhD, Polytechnic University
Wireless Communications and Networks
Mohamed Zahran, Research Associate Professor
PhD, University of Maryland at College Park
*Computer architecture, memory-hierarchy for multicore/manycore processors*

Yang Xu, Research Assistant Professor
PhD, Tsinghua University (China)
*High-speed networking*

**Adjunct Faculty**

Walid Ahmed, Adjunct Lecturer
PhD, Queens University (Canada)

Barbaros Aslan, Adjunct Lecturer
PhD, Cornell University

Eric Brendel, Adjunct Lecturer
MS, Pennsylvania State University

Mark Cavallaro, Adjunct Lecturer
MBA, Iona College

Tapan Chakraborty, Adjunct Lecturer
PhD, Rutgers University

Robert DiFazio, Adjunct Lecturer
PhD, Polytechnic University

Gustae Duclos, Adjunct Lecturer
PhD, Polytechnic University

Barbara Gates-Karnik, Adjunct Lecturer
PhD, Fletcher School of Tufts University

Jalal Gohari, Adjunct Lecturer
BS, The City University of New York

Donald Grieco, Adjunct Lecturer
MBA, Long Island University, CW Post
MS, Polytechnic Institute of Brooklyn

Ian Harris, Adjunct Lecturer
M.Sc, Herriot-Watt University (Scotland)

Noah Jacobsen, Adjunct Lecturer
PhD, University of California, Santa Barbara

Lurng-Kuo Liu, Adjunct Lecturer
PhD, University of Maryland

Xiaoqiao Meng, Adjunct Lecturer
PhD, University of California, Los Angeles

Paul Moon, Adjunct Lecturer
PhD, University of Manitoba (Canada)
Hyung Myung, Adjunct Lecturer
PhD, Polytechnic University

Charles Perng, Adjunct Lecturer
PhD, University of California, Los Angeles

Richard Stern, Adjunct Lecturer
MS, Polytechnic University

George Sullivan, Adjunct Lecturer
MS, Polytechnic University

Dong Sun, Adjunct Lecturer
PhD, Stevens Institute of Technology

Sindhu Suresh, Adjunct Lecturer
PhD, Polytechnic Institute of NYU

Chin-Tuan Tan, Adjunct Lecturer
PhD, Nanyang Technological University (Singapore)

Gerald Volpe, Adjunct Lecturer
PhD, New York University

David Wang, Adjunct Lecturer
PhD, Polytechnic University

Fred Winter, Adjunct Lecturer
PhD, Polytechnic University

Catherine Zhang, Adjunct Lecturer
PhD, Harvard University

Li Zhang, Adjunct Lecturer
PhD, Columbia University

Zhenqxue Zhao, Adjunct Lecturer
PhD, Polytechnic University

Faculty Emeriti

David J. Goodman, Professor of Electrical and Computer Engineering
PhD, Imperial College, University of London (England)

Leonard Bergstein, Professor Emeritus of Electrical Engineering
PhD, Polytechnic Institute of Brooklyn

Henry L. Bertoni, Professor Emeritus of Electrical Engineering
PhD, Polytechnic Institute of Brooklyn

Leo Birenbaum, Associate Professor Emeritus of Electrical Engineering and Electrophysics
MS, Polytechnic Institute of Brooklyn

Donald Bolle, Professor Emeritus of Electrical Engineering. Emeritus Provost
PhD, Purdue University
Joseph J. Bongiorno, Jr., Professor Emeritus of Electrical Engineering
DEE, Polytechnic Institute of Brooklyn

Robert Boorstyn, Professor Emeritus of Electrical Engineering
PhD, Polytechnic Institute of Brooklyn

Edward S. Cassedy, Professor Emeritus of Electrical Engineering
DrEng, Johns Hopkins University

Bernard R. S. Cheo, Professor Emeritus of Electrical Engineering
PhD, University of California at Berkeley

Douglas A. Davids, Associate Professor Emeritus of Electrical Engineering
PhD, Johns Hopkins University

Rudolf F. Drenick, Professor Emeritus of Electrical Engineering
PhD, University of Vienna (Austria)

Herman Farber, Associate Emeritus Professor of Electrophysics
MEE, Polytechnic Institute of Brooklyn

Richard A. Haddad, Professor Emeritus of Electrical Engineering
PhD, Polytechnic Institute of Brooklyn

Donald F. Hunt, Professor Emeritus of Electrical Engineering
BS, University of Pennsylvania

Ludwik Kurz, Professor Emeritus of Electrical Engineering
EngScD, New York University

James T. LaTourette, Professor Emeritus of Electrophysics
PhD, Harvard University

Nathan Marcuvitz, University Professor Emeritus
DEE, Polytechnic Institute of Brooklyn

Maurice C. Newstein, Professor Emeritus of Electrophysics
PhD, Massachusetts Institute of Technology

Arthur A. Oliner, Professor Emeritus of Electrophysics
PhD, Cornell University

Istvan Palocz, Professor Emeritus of Electrical Engineering and Electrophysics
PhD, Polytechnic Institute of Brooklyn

Philip E. Sarachik, Professor Emeritus of Electrical Engineering
PhD, Columbia University

Harry Schachter, Professor Emeritus of Electrical Engineering
PhD, Polytechnic Institute of Brooklyn

Benjamin Senitzky, Professor Emeritus of Electrophysics
PhD, Polytechnic Institute of Brooklyn

Sidney S. Shamis, Professor Emeritus of Electrical Engineering
MS, Stevens Institute of Technology
Leonard G. Shaw, Professor Emeritus of Electrical Engineering
PhD, Stanford University

Jerry Shmoys, Professor Emeritus of Electrical Engineering
PhD, New York University

Theodore Tamir, University Professor Emeritus
PhD, Polytechnic Institute of Brooklyn

Wen-Chung Wang, Professor Emeritus of Electrical Engineering and Electrophysics
PhD, Northwestern University

Gerald Weiss, Professor Emeritus of Electrical Engineering
DEE, Polytechnic Institute of Brooklyn

Dante C. Youla, University Professor Emeritus
MS, New York University

Department of Finance and Risk Engineering

Head: Charles S. Tapiero
Deputy Head: Barry Blecherman

Mission

The Department of Finance and Risk Engineering creates world-class research and degree programs bridging theory and practice in our disciplines.

The Department

The Department of Finance and Risk Engineering (FRE) is a diversified research and degree granting department—the second in the U.S. to provide the MS degree in Financial Engineering—providing a broadly based education in corporate and computational finance and financial markets, risk finance (including credit risk, insurance and financial risk engineering) and technology and algorithmic finance. The department’s mission is to provide the talent and excellence needed by financial services industries and their many associated professions.

The department’s educational and MS-degree-granting programs, research and extracurricular activities seek to bridge theory and practice and meet the many and complex challenges that the financial engineering professions are confronted with now and in the future. Graduates may assume diversified employment positions in the many facets that make up the financial engineering profession. Trading desks, hedge fund and investment managers, CFOs, quantitative professionals, insurance firms, financial technology managers as well as financial and specialized risk managers define the broad set of professions that are open to NYU-Poly’s graduates in financial engineering.

The department’s curriculum combines a rigorous vision of economics, finance, applied quant finance, actuarial science and financial technology in their theoretical and practical setting in a global world and global financial markets.

In addition, the department provides interdisciplinary certificate and opportunities to combine studies, such as computer science, mathematics and engineering with financial management and technology and risk engineering.

The department is based both in Brooklyn at the MetroTech Center and in Wall Street, in the midst of the world’s leading financial center. Our MS degrees and certificates offer specialization tracks spanning Corporate and Financial Markets (CM),
Computational Finance (CF), Technology and Algorithmic Finance (TAF), and Risk Finance (RF) emphasizing the convergence of credit risk, insurance and financial risk management.

The department is staffed by a number of leading academics and practitioners, both nationally and internationally, and boasts a number of outstanding affiliated professors and cutting-edge traders, hedge funds managers and academics turned practitioners by the lure of Wall Street. This combination of talent, theoretically and practically based, national and international, provides a first-rate education embedded in answering the real needs of the financial services sector that recognizes the continuous growth of finance, financial insurance and risk engineering, technology, financial engineering and management in an increasingly global world. In addition, the department has a Research Institute that emphasizes specialized research areas and provides a public service. These include:

- Research focusing on of the many issues that transpired following the financial credit crisis, incomplete markets finance (including rare, Black Swans and uncommon risks finance, financial regulation, leverage, liquidity and corporate structure, real finance and business policy, alternative and behavioral finance as well as topical projects pursued by students and faculty.
- Research on Algorithmic Trading, emphasizing trading platforms and software development and the management of financial technology. The institute is a research hub as well as a laboratory for generating new ideas in computer science and finance. The Institute undertakes collaborative research projects to provide ideas, methods and tools with scholarly and practical applications with the purpose of opening greater opportunities for our students when they graduate.
- Research in corporate finance, liquidity management and the many facets of theoretical and applied finance.

The department operates in close collaboration with NYU’s other educational programs (such as the Financial Mathematics program at the Courant Institute of Mathematical Sciences) as well as a number of universities in Europe and China. Collaborative agreements will allow some students to visit other similar programs and profit from more diversified cultures and experiences that are essential today in a more global financial environment.

The Profession

Financial engineering is driven by financial practice to bridge means and ends and to reconcile the theoretical foundations of financial economics with the reality of financial markets. Finance is about money and therefore, all problems that can be transformed to a real or to a synthetic financial money framework can profit by the extent to which money is used and exchanged. It is in such a perspective, that many economic and engineering problems can be conceived as “financial engineering problems.” This conception of financial engineering underpins the NYU-Poly Institute programs in finance. In this spirit, our goal and objectives pertain to trading, speculating, investing, pricing and corporate and risk management but also to pricing and managing the risks of infrastructure, the environment and business management. In this sense, financial engineering as with all technology and scientific based professions is a “work in progress,” whose purpose is to present and communicate with practitioners and financial engineering students to better prepare their entering the world of finance. We meet the challenges of financial markets—in analysis, pricing, trading and investing—for technology managers and computational finance engineers in fast-moving, highly rewarding careers that create value enabled by finance, technology and computational mathematics.

Degrees Offered
Master of Science in Financial Engineering

Tracks

- Financial Engineering, Financial Markets and Corporate Finance Track, M.S.
- Financial Engineering, Technology and Algorithmic Finance Track, M.S.

Graduate Certificates

- Financial Engineering Graduate Certificate
- Financial Technology Management Graduate Certificate
- Financial Risk Management Graduate Certificate

Classrooms

Manhattan Location
55 Broad Street, Lower Concourse
New York, NY 10004

Graduate and Certificate Programs

The Master of Science Program

The Master of Science in Financial Engineering (FE) is a 33-credit program designed to provide the skills required to operate at the cutting-edge of financial engineering in today’s financial services industry. Separate tracks make it possible to pursue careers in financial markets and corporate finance, in financial technology, in computational finance or in risk finance. The program is rigorous, demanding and selective.

Graduates of the Financial Markets and Corporate Finance Track are expected to seek positions in financial management groups, on trading and arbitrage desks, in product structuring groups, in derivatives groups, in investment banking departments and in the information-technology firms that support the trading operations of financial institutions.

Graduates of the Technology and Algorithmic Finance Track are actively involved in the development and implementation of the entire spectrum of algorithmic trading strategies, software applications, databases and networks used in modern financial services firms. The techniques it applies bridge computer science and finance to prepare graduate to participate in large-scale and mission-critical projects. Applications include high frequency finance, behavioral finance, agent-based modeling and algorithmic trading and portfolio management.

The Computational Finance Track emphasizes both financial quantitative theory and practice, bridging the two and using both the fundamental concepts of finance and the stochastic and optimization methods and software in finance. This track is meant for those individuals with a strong desire to become quantitative financial managers or to pursue applied finance research interests in cutting-edge investment science, trading and in financial risk management. Techniques such as quantitative finance, financial econometrics, stochastic modeling, simulation and optimization are part of a set of financial tools applied to the many problems of derivatives and options finance, arbitrage trading algorithms, asset pricing, credit risk and credit derivatives, developing new derivative products and the many areas where quant finance has a contribution to make.

Graduates of the Computational Finance Track will be qualified to work in pricing financial risk and their management, in credit risk and their derivatives, in cutting-edge institutions, in quant hedge funds and in research and advanced product development departments of financial and consulting firms. Graduates of the Risk Finance Track will have the qualification and abilities to become responsible specialists for positions in finance, credit granting firms, banks and insurance companies, as well as obtain the knowledge needed to face the upcoming complex problems arising by the increased use and centrality of financial insurance products (contributing to the development of complex financial products and a convergence) of finance and insurance. The complementary actuarial profession is a discipline that uses tools from statistics, probability theory and finance to analyze and
solve practical problems in insurance and financial risk management. Actuaries assemble and analyze data to estimate the probability and likely cost of an event such as death, sickness, injury, disability or loss of property. Courses in risk finance provide the background for the first four actuarial examinations supervised by the Society of Actuaries and the Casualty Actuarial Society and cover additional educational experience requirements. The department both supports and encourages students in their preparation for and the acquisition of such certificates as these are important elements in job-seeking in the insurance-quant sector.

NYU-Poly’s Master of Science in Financial Engineering brings together four key areas: finance and related business disciplines, quantitative analysis (mathematics and statistics), information technology (telecommunications and computer science) and management. In addition, it provides an opportunity to attend to the many areas of business and management where finance is an essential element.

The financial and practical component of the educational program has been further strengthened by developing a large and versatile body of adjunct faculty consisting of leading financial market practitioners from major Wall Street firms and international professors’ affiliates. These adjunct faculty members work closely with NYU-Poly’s full-time faculty emphasizing both applied and theoretical research in bringing to financial engineering students a greater sensitivity to the needs and the demands of financial markets and the management of financial services and institutions.

Admissions

The Master of Science in Financial Engineering at Polytechnic Institute is very highly selective. All applicants must present transcripts from all colleges and universities they have attended as well as GRE (Graduate Record Exam) or GMAT (Graduate Management Admission Test) test scores; there are no exceptions to this rule. (Please note that the department strongly prefers GRE scores over GMAT scores.) Applicants who have undergraduate average above 3.0 or a master’s degree and also have a GRE or GMAT quantitative score that is superior and a verbal score that shows competence in English are considered for admission. Completed applications must be received by Polytechnic by April 1 for consideration for the fall semester or by October 15 for consideration for the spring semester.

For the GRE or GMAT, the institution code is 2668; a department code is not necessary. Additionally, the applicant must have sufficient proficiency and aptitude in mathematics. This may be demonstrated by grades earned in relevant course work and/or standardized examinations. This criterion is not entirely objective and will be established by the Academic Director. Applicants who meet the above criteria are by no means guaranteed admission, which is also based on a competitive performance of applicants.

Two letters of recommendation are also required for admission. The student must demonstrate a proficiency in the English language as measured by verbal scores on the GRE or GMAT or successfully complete a series of ESL courses in order to commence formal study.

The Graduate Certificates associated with the Financial Engineering Program have the same application requirements and prerequisites as the Master of Science degree.

Applicants requesting admission for study only in a particular course or group of courses are given Special or Visiting Student Status, which permits registration, generally for a limited duration, in those courses indicated by the approval of admission. Registration is limited to 6 credits per semester. If additional courses are desired after the end of the specified period, a new admission request must be filed through the admissions office. Special Status students who later apply for and are accepted to the master’s or certificate program may transfer up to 9 credits taken while on Special Status. Special Status students are expected to complete the GRE or GMAT exam before applying for admission to MS FE or any associated Graduate Certificate. The GPA earned as a Special Status student will be used as part of the admissions decision in place of the undergraduate GPA.

Individuals interested in applying for admissions to either the Master of Science in Financial Engineering or the Graduate Certificate Program please visit the Graduate Admissions website page at www.poly.edu/graduate. The site has a downloadable application and information on tuition and financial aid.
Undergraduate Minor

The Department of Finance and Risk Engineering offers an Undergraduate Minor in Finance. The intent of this program of study is to allow NYU-Poly undergraduate students in the sciences and engineering to leverage their mathematical talents in a selected number of appropriate courses. For more information on the Finance Minor, contact Prof. Barry Blecherman at (718) 260-3398 or blecherman@poly.edu.

Faculty

Professors

Charles S. Tapiero, The Morton and Angela Topfer Distinguished Professor in Financial Engineering and Technology
Management, Department Head of Finance and Risk Engineering
PhD, New York University
MBA New York University B. App. Science (Electrical Engineering), Polytechnique-University of Montreal
Financial engineering, business and operations risks engineering and management

Nassim Nicholas Taleb, Distinguished Professor of Risk Engineering
PhD, University of Paris (Paris 9Dauphine),
MBA, Wharton School, University of Pennsylvania
Domestication of the unknown, philosophy of chance, uncertainty and probability

Assistant Professor

Philip Maymin, Assistant Professor of Risk Engineering
PhD, University of Chicago
Alternative and behavioral finance

Industry Faculty

Franziska Berger, Industry Assistant Professor of Mathematics and Financial and Risk Engineering
PhD, Munich University of Technology Discrete mathematics

Barry S. Blecherman, Industry Professor of Financial Engineering
PhD, Wharton School of the University of Pennsylvania
Information economics and strategy, decision theory, business negotiations

Fredrick Novomestky, Industry Professor of Financial Engineering
PhD, Polytechnic Institute of Brooklyn
Asset/liability modeling and management, evolutionary computational algorithms for mathematical optimization, multiple criteria decision making models, quantitative investment strategy

Research Fellow

Anne Zissu, Research Fellow
PhD, The Graduate School and University
Center of the City University of New York Corporate finance, risk management, securitization
Adjunct Faculty

Sassan Alizadeh, Adjunct Associate Professor of Financial Engineering
PhD, Wharton School of the University of Pennsylvania
Term-structure model, quantitative trading strategies

Lucas Bernard, Adjunct Associate Professor of Financial Engineering
PhD, The New School for Social Research
Credit derivatives, corporate finance

Paul Biederman, Adjunct Associate Professor of Financial Engineering
PhD, New School University
Financial market regulation, industry economic analysis

Robert Biolsi, Adjunct Associate Professor of Financial Engineering
PhD, City University of New York
Innovation, equity prices and commodity diversification, electricity deregulation

Jean-Carlo Bonilla, Adjunct Associate Professor of Financial Engineering
MS, Polytechnic University
Quantitative methods in finance

Peter Cai, Adjunct Associate Professor of Financial Engineering
PhD, Pennsylvania State University
Trading, hedge funds and risk engineering

Raphaëlle Chappe, Adjunct Associate Professor of Financial Engineering
JD, New York University School of Law
Taxation and regulation in finance

Rohan Douglas, Adjunct Associate Professor of Financial Engineering
BSc, Sydney University (Australia)
Market theory, credit derivatives

Roy Freedman, Adjunct Associate Professor of Financial Engineering
PhD, Polytechnic Institute of New York
Evolutionary information technology, quantitative methods in finance, artificial intelligence

Sebastien Galy, Adjunct Associate Professor of Financial Engineering
PhD, Concordia University
Dynamic asset pricing, option pricing

Barry Guttenplan, Adjunct Associate Professor of Financial Engineering
MPhil, Yale University
Taxation and finance, credit derivatives

Thomas Hutchinson, Adjunct Associate Professor of Financial Engineering and Management
MA, McMaster University (Canada)
Investment banking, financial economics

Maureen Koetz, Esq., Adjunct Associate Professor of Financial Engineering
JD, Washington College of Law
Environmental finance
Andrew Kalotay, Adjunct Associate Professor of Financial Engineering
PhD, University of Toronto
*Debt management, valuation of bonds, interest-rate derivatives and mortgage-backed securities*

Victor Makarov, Adjunct Associate Professor of Financial Engineering
PhD, Academy of Sciences - Moscow
*Value at risk, financial regulation*

Steven Mandel, Adjunct Associate Professor of Financial Engineering
PhD, New York University
*Risk management, portfolio optimization, return attribution*

Ingrid Marshall, CPA, Adjunct Associate Professor of Financial Engineering
MBA, St. John’s University
*Corporate financial accounting*

Anthony Pepennella, Adjunct Associate Professor of Financial Engineering
Florida State University, Financial and Operations Principal: Series 24, NASD Registered Representative: Series 7, NASD
*Financial accounting, financial statement analysis*

Ronald T. Slivka, Adjunct Associate Professor of Financial Engineering
PhD, Wharton School of the University of Pennsylvania
*Quantitative approaches to derivative securities valuation and applications, quantitative investment strategies*

Richard Van Slyke, Adjunct Associate Professor of Financial Engineering Professor Emeritus of Computer Science
PhD, University of California, Berkeley
*Financial risk optimization*

Charles Stone, Adjunct Associate Professor of Financial Engineering
PhD, City University of New York
*Editor of The Financier and The Securitization Conduit*

Kimberly Swain, Adjunct Associate Professor of Financial Engineering
BA, University of Texas, Austin, Series 7 and 63
*Infrastructure finance*

Daniel Totouom-Tangho, Adjunct Associate Professor of Financial Engineering
PhD, École des Mines Paris, Polytechnique-Paris
*Financial modeling, stochastic calculus*

Edward Dean Weinberger, Adjunct Associate Professor of Financial Engineering
PhD, Courant Institute of Mathematical Sciences, New York University
*Credit risk measurement and management*

**International Professors Associates**

Alain Bensoussan, Polytechnic University of Hong Kong and University of Texas, Dallas

Ron Kennett, University of Torino, Italy and KPA-Israel

Konstantin Kogan, Bar Ilan University, Israel

W.K. Li, The University of Hong Kong

Bertrand Munier, ENSAM and the University of Paris I, France
Department of Mathematics

Head: Erwin Lutwak

The Department of Mathematics is committed to excellence and innovation in the teaching and research of mathematics. Current active areas of research include geometric analysis, differential topology and partial differential equations. The bachelor’s, master’s and doctoral degree programs provide both a solid foundation in mathematics and extensive exposure to how mathematics is used in practice. Half of a mathematics major’s courses are taken in other departments. The department also offers a complete spectrum of undergraduate and graduate courses.

Mission Statement

The mission of the Department of Mathematics is to develop and implement innovative teaching strategies designed to help each student understand fundamental mathematical concepts and to use these concepts to excel in subsequent science and engineering courses.

Students taking departmental courses become confident in their abilities to reason rigorously, use the language of mathematics properly, write and speak about mathematical ideas precisely and concisely and appreciate the amazing power of mathematics to describe phenomena in the world. Students learn how to use mathematical software as a tool in the study and application of mathematics.

The Department

The department offers BS, MS and PhD degrees, with a strong interdisciplinary focus. The BS in Mathematics, for instance, has an optional concentration in physics. The MS in Mathematics focuses on strong abstract and quantitative reasoning abilities. The PhD in Mathematics encourages work applying advanced mathematics in other disciplines, with the major adviser from those disciplines.

To support its academic quality and to strengthen interdisciplinary work, the department’s research excels in the areas of convex geometry and the analysis of nonlinear partial differential equations arising from gauge field theory.

Degrees Offered

Bachelor of Science

- Mathematics, B.S.

Master of Science

- Mathematics, Examination Option and Designated Sub-specialty Option, M.S.
• Mathematics, Examination Option, M.S.
• Mathematics, Thesis Option, M.S.

Doctor of Philosophy

• Mathematics, Ph.D.

Faculty

Professors

Monika Ludwig, Professor of Mathematics
PhD, Technische Universität Wien
Convex geometry, valuations, geometric and analytic inequalities

Erwin Lutwak, Professor of Mathematics, Department Head
PhD, Polytechnic Institute of New York
Geometric analysis

Edward Y. Miller, Professor of Mathematics
PhD, Harvard University
Differential topology

Deane Yang, Professor of Mathematics
PhD, Harvard University
Geometric analysis

Yisong Yang, Professor of Mathematics
PhD, University of Massachusetts at Amherst
Partial differential equations, mathematical physics

Gaoyong Zhang, Professor of Mathematics
PhD, Temple University
Geometric analysis

Associate Professors

Kathryn Kuiken, Associate Professor of Mathematics
PhD, Polytechnic Institute of New York
Complex analysis, group theory
Joel C. W. Rogers, Associate Professor of Mathematics
PhD, Massachusetts Institute of Technology
Partial differential equations, fluid mechanics, numerical methods

Industry Faculty

David V. Chudnovsky, Distinguished Industry Professor of Mathematics
PhD, Institute of Mathematics, Ukrainian Academy of Science

Gregory V. Chudnovsky, Distinguished Industry Professor of Mathematics
PhD, Institute of Mathematics, Ukrainian Academy of Science
Number theory: analytic number theory, diophantine approximations and transcendence theory. Mathematical physics: nonlinear equations, quantum and classical fields. Computer science: computer algebra and complexity, large-scale numerical mathematics, parallel computing and digital signal processing

Assistant Professor

Franziska Berger, Assistant Professor
PhD, Munich University of Technology
Discrete mathematics

Teaching Faculty

Vanita Khosla, Instructor
MS, Polytechnic Institute of NYU
Calculus, precalculus

Harvansh Manocha, Industry Professor of Mathematics
PhD, Panjab University (India)
Lie groups and special functions

Luciano Medina, Instructor
MS, Polytechnic Institute of NYU
Partial differential equations and mathematical biology

Arman Mimar, Instructor
PhD, Columbia University
Number theory, arithmetic geometry

Jinghua Qian, Instructor
PhD, Tufts University
Probability and stochastic process, statistics

Tom Pranayanantana, Instructor
PhD, Polytechnic University
Matrix inequalities, discrete convexity and convex geometry
**Adjunct Faculty**

**Michel Lobenberg**, Adjunct Professor  
PhD, Columbia University  
*Banach spaces, probability and stochastic processes, mathematical physics*

**Sudhakar Mishra**, Adjunct Professor  
PhD, City University of New York  
*Algebraic topology, computational number theory, statistical and mathematical modeling, fuzzy set theory, diagnostic pattern recognition, proteomics*

**Jiazu Zhou**, Research Professor  
PhD, Temple University  
*Convex geometry, integral geometry*

**Adjunct Instructors**

**Irina Bronstein**  
MS, Donetsk University

**Amakoe Gbedemah**  
MA, Queens College

**Daniel Khachatorian**  
BS, Polytechnic Institute of NYU

**Rachel Jacobovits**  
MS, Polytechnic University

**Liana Lazarashvili**  
MS, Georgian Academy of Science

**Vaishali Prabhu**  
PhD, Karnataka University

**Abraham Sher**  
ME, City College of New York  
MA, Brooklyn College

**Hanna Ulman**  
BA, Hebrew University  
Teaching Certificate, Tel Aviv University

**Fang Zhao**  
MS, Polytechnic University

**Faculty Emeriti**
Department of Mechanical and Aerospace Engineering

Head: George Vradis

Mission Statement

The mission of the Department of Mechanical and Aerospace Engineering is to prepare students for careers in mechanical and related engineering disciplines for professional development, life-long learning and contributions to society. Furthermore, the department adds value to the student’s market and career potential by emphasizing an understanding of the physical world through projects, tools and practice, and by providing the foundation tools for innovation, invention and entrepreneurship.

The Department

The Department of Mechanical and Aerospace Engineering is an ideal destination for U.S. and international students interested in joining a dynamic department that offers educational and research opportunities in traditional and emerging areas of mechanical engineering. The department not only stresses creativity and innovation, but also emphasizes fundamental understanding of the underlying sciences, design methodologies and economic and social impact of engineered products. Polytechnic graduates hold leadership positions worldwide in careers spanning academia, industry and governmental and non-governmental organizations in both the engineering and other professional fields.

The undergraduate mechanical engineering curriculum balances fundamental science and engineering principles and engineering practice. Courses emphasize engineering- science fundamentals and computer applications that employ modern engineering tools. The program heavily emphasizes laboratory experience, engineering design and student participation in research programs.

Graduate studies provide a broad understanding of the mechanical engineering field combined with a deep understanding of one of its sub-disciplines, while they promote interdisciplinary studies, student professional development and lifelong learning skills. Traditional and emerging mechanical engineering-related areas of study are available. Program flexibility allows students to satisfy intellectual interests and pursue professional goals. Coursework and research opportunities are available in areas that include dynamical and complex systems, controls, composite materials and nano-materials, biomimetics, lasers and optical
sensors, fluid mechanics and energy systems and fire research. State-of-the-art laboratory and computational facilities support the educational and research enterprise, while the low faculty-to-student ratio warranties the development of close student-faculty ties the graduate program’s relatively small size allows students to form close relationships with faculty Adviser, greatly strengthening and enriching the students’ experience and intellectual growth.

Students are encouraged to join Polytechnic’s student chapters of the American Society of Mechanical Engineers (ASME), American Institute of Aeronautics and Astronautics (AIAA), National Society of Black Engineers (NSBE), Engineers Without Borders (EWB), Society of Women Engineers (SWE) and Society of Automotive Engineers (SAE), as well as honor societies, Pi Tau Sigma for mechanical engineers and Tau Beta Pi for engineers in general.

Polytechnic students benefit significantly from participation in cutting-edge research (funded by government, industry and not-for-profit organizations), access to state-of-the-art laboratories, collaboration with a faculty that cares greatly for students and devotes its energy to their growth, and living in one of the world’s greatest cities.

The Profession

Mechanical engineers design, build and maintain the products and processes that define industrial and post-industrial societies. In its early days, mechanical engineering emerged as the discipline dedicated to producing power and building the first industrial machines. Mechanical engineering has evolved to the broadest of all engineering disciplines. Today, mechanical engineers are prime movers of innovation and invention in a wide range of dynamic and continually evolving industries. These industries include power production and aerospace, robotics and manufacturing, transportation and communication, electronics and mechatronics, and biotechnology and biomimetics. Mechanical engineers also have a long tradition of leadership in helping to develop and safeguard the natural environment by creating breakthroughs in such areas as resource conservation, improved efficiency of energy-consuming devices, development of codes for a safer technological environment, and new green energy sources. The breadth of their training allows some mechanical engineers to apply their training to the diversified fields of computer engineering, nanotechnology, software development, financial engineering, bioengineering, astronautics, systems engineering, corporate management, law and medicine. As Polytechnic graduates mature and realize their abilities, their professional lives may center on engineering research, government, business, education or entrepreneurship.

Contact Information

Degrees Offered

The department offers degree programs in mechanical engineering at the Bachelor of Science, Master of Science and Doctor of Philosophy levels. The undergraduate Bachelor of Science program is accredited by the Engineering Accreditation Commission (AEC) of the Accreditation Board of Engineering and Technology (ABET). The doctoral degree is approved by the New York State Doctoral Program Review.

The objectives of the undergraduate mechanical-engineering program are for its graduates to: 1) engage in, and advance in, professional careers in mechanical or related engineering, or other career paths that include industry, academia and governmental or nongovernmental organizations, and 2) seek continuous professional development and life-long learning through graduate-school studies, continuing-education credits and professional registration.
The department offers BS, MS and PhD degrees in mechanical engineering. Specific information about these programs may be found in the programs section of the catalog.

**Bachelor of Science**

- Mechanical Engineering, B.S.
- Mechanical Engineering, Aerospace Concentration, B.S.

**Master of Science**

- Mechanical Engineering with concentrations in mechanics and structural systems, controls and dynamic systems and fluid dynamics and thermal systems

**Doctor of Philosophy**

- Mechanical Engineering, Ph.D. with concentrations in aerospace engineering, materials engineering, mechanics and structural systems, controls and dynamic systems and fluid dynamics and thermal systems

**Faculty**

**Professors**

**Vikram Kapila**, Professor of Mechanical Engineering  
PhD, Georgia Institute of Technology  
Linear/nonlinear control, distributed spacecraft formation flying and attitude control, mechatronics

**Sunil Kumar**, Professor of Mechanical Engineering  
PhD, University of California at Berkeley  
Thermal fluid sciences, applied mathematics

**Said Nourbakhsh**, Professor of Materials Science  
PhD, Leeds University (England)  
Phase transformation, electron microscopy, composite and smart materials, ferroelectric thin films

**Michael J. Shelley**, Professor of Mechanical Engineering and Lilian and George Lyttle Professor of Applied Mathematics at Courant Institute of Mathematical Sciences at New York University  
PhD, University of Arizona  
Fluid dynamics, computational physics, numerical analysis

**Associate Professors**

**Salvatore Grimaldi**, Associate Professor of Mechanical Engineering and Associate Professor of Applied Hydrology at Universita degli Studi della Tuscia  
PhD, Universita di Roma “La Sapienza”  
Applied and statistical hydrology, GIS terrain analysis, tracer methods for hydrological applications

**Nikhil Gupta**, Associate Professor of Mechanical Engineering  
PhD, Louisiana State University  
Micro- and nano-composite materials/mechanics

**Iraj M. Kalkhoran**, Associate Provost of Undergraduate Academics and Associate Professor of Aerospace Engineering  
PhD, University of Texas at Arlington  
Gas dynamics, high-speed flows, wind tunnel testing, shock tubes
Maurizio Porfiri, Associate Professor of Mechanical Engineering
PhD, Virginia Polytechnic Institute and State University
*Dynamics, vibrations, computational mechanics, robotics*

Richard S. Thorsen, Associate Professor, Vice President Emeritus and Senior Advisor to the President
PhD, New York University
*Heat transfer, energy systems, solar and nuclear energy*

George Vradis, Associate Professor of Mechanical Engineering and Department Head
PhD, Polytechnic University
*Computational fluid dynamics and heat transfer, energy systems*

**Assistant Professors**

Remi Dingreville, Assistant Professor of Mechanical Engineering
PhD, Georgia Institute of Technology
*Theoretical and computational mechanics, multi-scale modeling, advanced materials*

Joo Kim, Assistant Professor of Mechanical Engineering
PhD, The University of Iowa
*Multibody dynamics, optimization theory, robotic manipulation, bioengineering*

Sean Peterson, Assistant Professor of Mechanical Engineering and Assistant Professor of Mechanical & Mechatronics Engineering at University of Waterloo, Canada
PhD, Purdue University
*Fluid mechanics, bio-fluid mechanics, energy harvesting*

**Industry and Research Professors**

Joseph Borowiec, Industry Associate Professor
PhD, Polytechnic Institute of New York
*Finite elements method, structural mechanics, design*

Annalisa Scacchioli, Visiting Assistant Professor of Mechanical Engineering
PhD, University of L’Aquila (Italy)
*Automatic control, automotive systems*

Peter S. Walker, Research Professor of Mechanical Engineering and Research Professor of Orthopedic Surgery at New York University Hospital for Joint Diseases
PhD, University of Leeds
Orthopedics, minimally invasive surgery

**Adjunct Faculty**

Nicholas Dizinno
MS, Polytechnic University
*Computer-aided design*

Mehdi Naraghi
PhD, Polytechnic Institute of New York
*Thermal and fluid systems*
Sang-Hoon Lee
PhD, Polytechnic University
*Measurement systems and automatic control*

Nguyen Q. Nguyen
PhD, Polytechnic Institute of NYU
*Mechanics of materials, sensors*

Kee M. Park
PhD, Stevens Institute of Technology
*Machine design*

Iskender Sahin
PhD, Virginia Polytechnic Institute and State University
*Thermal and fluid systems*

Paul Sutton
JD, Brooklyn Law School
*Intellectual property, intersections of law, engineering and business*

Ali Vedavarz
PhD, Polytechnic University
*Energy systems, green energy, HVAC*

## Faculty Emeriti

Philip Abrami, Professor Emeritus

Prerequisite(s): Prerequisite: Graduate standing

Department of Technology Management

Head: Bharat Rao

Mission Statement

The mission of the Department of Technology Management is to act as a major educational gateway and premier learning and research hub devoted explicitly to broadly defined innovation and technology management and entrepreneurship. The scholarly intellectual capital it produces and its tailored programs at the undergraduate, graduate and doctoral levels enable the department to provide unique and valuable opportunities for students, practicing managers and scholars. The department is committed unequivocally to upgrade and revise continually its learning programs and courses to meet fast-changing demands of a dynamic, innovation-driven and competitive environment and to be an academic leader in technology management.

The Department

Effective technology and innovation management and entrepreneurship increasingly determine success in business today. The Department of Technology Management is an acknowledged pioneer and leader in the New York City/tri-state region and beyond in offering courses and programs about these increasingly critical arenas. The department serves a diverse and broad range of professionals, and its faculty and students compose a vital and forward-thinking research and learning community. The department’s research and educational offerings focus on a broad range of sectors, including financial and professional services; retailing and logistics; bio-medical, biotechnology and pharmaceuticals; renewable energy and clean technology; media and
entertainment; IT, telecom, networks and modern electronic business; and non-for-profits and government—all constituting areas of greatest growth and opportunity in the modern economy, especially in New York City, the nation’s foremost global city.

Degrees Offered

Bachelor of Science
- Business and Technology Management, B.S.

Master of Science
- Information Management (eIM) - Concentrations: Information Management (IM), Information Management (IMCIO) and Information Management (IMCISO)
- Management of Technology, M.S. (MOT)*
- Organizational Behavior (MSOB) - Concentrations: Human Resource Information Systems, Human Resources Management, Management of Change and Training and Development

Doctor of Philosophy
- Technology Management, Ph.D.

Graduate Certificates
- Construction Management Graduate Certificate**
- Electronic Business Management Graduate Certificate
- Entrepreneurship Graduate Certificate
- Human Resources Management Graduate Certificate
- Information Management Graduate Certificate
- Organizational Behavior Graduate Certificate
- Project Management Graduate Certificate
Research Profile

The Department of Technology Management consists of an interdisciplinary group of scholars that studies various aspects of technology and innovation - strategic, behavioral, organizational and sociological. Some specific streams of research and sub-topics include:

- Global innovation and R&D strategy - Managing emerging technologies - Technology and development - Service design and innovation - Tech entrepreneurship and commercialization - Sustainable and clean-tech innovation
- Impacts of information technology upon individuals, organizations and society - Citizen science - Social computing - Open source - Business model innovation - Pervasive information services
- Sociological aspects of technology and work - Communicative practices - Distributed collaboration and virtual teams - Knowledge management - Leading Distributed and Virtual Organizations - Project Management

Educational Programs

Undergraduate Program

The Department of Technology Management offers a Bachelor of Science in Business and Technology Management (BTM). This program prepares students to be next-generation managers in fields dominated by technological innovation and especially the rapid advancement of information technology and other fields in the applied science and engineering disciplines. Students completing the BTM Program are prepared to succeed in positions such as technology project leaders, technology savvy entrepreneurs, technology and IT analysts, customer-relationship managers and in other cross-functional roles, and developers of business innovations in financial services and other professional services fields.

Minor in Management

Undergraduate students may obtain a Management Minor by completing 14 credits of undergraduate management courses. An overall GPA of at least 2.0 must be maintained. At least 8 of the 14 credits must be taken by students while enrolled at Polytechnic.

Graduate and Certificate Programs

The department offers a portfolio of redesigned and modernized educational programs, all dealing with the broad spectrum of innovation, technology management and entrepreneurship in the modern economy, and the department’s graduate programs attract a wide range of students and professionals. This is because all managers should understand how technology and innovation management and entrepreneurship are essential for delivering value to organizations and to the market.

The department offers several graduate and professional programs, two of which are earned in executive management format (meeting every other week on Thursday evening and all day Saturday) and four of which are offered on weekday evenings. One program is offered in both formats.
The department’s graduate and professional programs include:

Students may pursue the MOT, MSM and MS-OB programs either part time or full time with an evening schedule. Each has concentrations that allow students to specialize in selected areas.

The department also offers advanced graduate certificates from the MSM and MS-OB Programs, which consist of sequences of courses leading to advanced knowledge in a desired area of specialization.

**Graduate Programs**

We encourage and welcome prospective students to apply to our other thriving and innovative graduate programs: the Management of Technology (MOT) and Information Management (IM) Executive Master’s programs, the Master’s of Science—Management (MSM) and the Master’s of Science—Organization Behavior (MS-OB). Further information on these programs can be found on the department’s website.

**Doctor of Philosophy in Technology Management**

Modern technologies increasingly and profoundly affect the management of products, services, processes, organizational forms, business models, the shape of industry structures and modern business environments, the available kinds of technology-enabled innovation and the capability of integrating technology and management—all aimed at creating value for customers and organizations. The ability to conduct research on and to educate about the managerial implications of such topics—all composing technology management—is a highly sought-after and important arena for business scholarship and education. The PhD in Technology Management provides this increasingly significant set of scholarly and educational opportunities.

This degree program is for research-oriented students. Both full-time and part-time students are accepted. Admission criteria include academic record, professional experience, research potential, GMAT or GRE scores, references and a writing sample.

Please visit the program’s website for more information.

All management undergraduate and graduate degree programs, as well as certificate programs, are further described in this catalog.

**Student Professional Societies, Associations and Organizations**

The Management of Technology and the Information Management Executive Programs Alumni Association actively seek to continue and expand shared professional experience gained during and after the programs. Members meet face to face or electronically to share insights obtained in their work experiences and to debate issues broadly relevant to technology management.

The Organizational Behavior Program sponsors an award-winning student chapter of the Society for Human Resources Management (SHRM). The PolySHRM chapter was selected as one of the top 10 in the country by national SHRM. PolySHRM sponsors forums with experts and provides opportunities for professional networking and mentoring to enhance a student’s education and career.

The student club associated with the Bachelor of Science in Business and Technology Management degree program is a strong and valued component of the social fabric of undergraduate life at Polytechnic. This organization works to create professional knowledge and opportunities for members.

Departmental representatives are available for student advising at all NYU-Poly campuses — Brooklyn, Long Island and Westchester— and at the Manhattan location.
Extension in Israel

The Department of Technology Management offers the Master of Science in Management (MSM) as well as in Organizational Behavior (OB) at its extension in Israel. The Polytechnic Israel extension program was initiated in 1997 by Polytechnic Management Professor Harold Kaufman to fill a local demand for managerial expertise.

The programs are identical to the evening curricula in New York and offer selected concentrations specifically for professionals and managers working in Israeli business and industry. The program brings cutting-edge technology management approaches taught by Polytechnic professors together with Israeli faculty to address the advanced state of technology in Israel.

For further information about the extension in Israel, contact Academic Director Harold Kaufman at (718) 260-3485 in New York or by e-mail at hkaufman@poly.edu.

Faculty

Professors

Mel Horwitch, Professor of Technology Management; on leave
MBA, DBA, Harvard University
AB, Princeton
Innovation management, global innovation, technology strategy, technology policy

Harold G. Kaufman, Professor of Technology Management; Academic Director, Organizational Behavior Program; Academic Director, Department of Management Extension in Israel MIE,
PhD, New York University
BME, Cooper Union for the Advancement of Science and Art
Managing professional and technical workers, career management, obsolescence of knowledge and skills, research methods

Associate Professor

Bharat P. Rao, Associate Professor of Technology Management and Department Chair
PhD, University of Georgia
Managing emerging technologies, broadband, wireless and digital business, global innovation, strategic marketing, IT in the supply chain, alliances, networks and collaborative enterprises

Assistant Professors

Anne-Laure Fayard, Assistant Professor of Technology Management and Academic Director,
PhD Program in Technology Management
PhD, Ecole Des Hautes Etudes en Sciences Sociales (France)
Discourse analysis, communication, online communities, social-material practices, space and culture

Oded Nov, Assistant Professor of Technology Management
PhD, University of Cambridge, UK,
MSC, London School of Economics, UK
Technology management, behavioral aspects of information systems, knowledge management, motivations of open source and user-generated content contributors
Industry Faculty

Jerry MacArthur Hultin, Industry Professor of Law, Management and Public Policy; President of Polytechnic Institute of NYU
JD, Yale University
Innovation management, global development, modern university education, technology policy

Joseph S. Nadan, Industry Professor of Technology Management; Director of eMOT and eIM Master’s Programs
PhD, New York University
Content innovation, social networks, global entrepreneurship, media management, wireless innovation, e-business

Technology, Culture and Society

Richard. C. Wener, Professor of Psychology
PhD, University of Illinois at Chicago
Environmental psychology, crowding, assessment of the built environment

Research and Faculty Faculty Emeriti

Seymour Kaplan, Associate Professor Emeritus of Operations Management and Management Science
PhD, New York University
Operations research and management

Adjunct Faculty

Frank Apicella
MBA, New York University
Finance

John Artise
MA, New York University
Global human resource management

Harun Asad
MBA, George Mason University
General management, marketing, innovation

Yair Berson
PhD, State University of New York Binghamton
Organizational behavior, leadership of high technology firms, strategic leadership

Tushar Bhattacharjee
PhD, Post-Doctoral Research, MIT and Osaka University
Data communications, electrical engineering

Parbati Bhattacharya
MS, Pace University
Finance

Rabindre Bhattacharya
MS, Mercy College
Economics, finance
Robert Biolsi
PhD, Graduate Center, College University of New York
Finance, inflation, equity prices and commodity diversification, electricity deregulation

Jabril Bensedrine
PhD, ESSEC Graduate School of Business (France)
Entrepreneurship, corporate entrepreneurship, technology strategy

Ravi Bhatia
MS, Polytechnic Institute of New York
Project management

Denise Bracamonte
BA, St. John University; PMP and PMI
Certified Project management
Project management

Aurora Brito
MBA, Suffolk University
Coaching in organizations, organizational behavior

Howard Bruck
MBA, Fordham University
Project management

Advisory Boards

Corporate and Academic

The Department of Technology Management maintains deep ties with a wide range of firms in a host of knowledge- and innovation-intensive sectors. The department is honored to have a distinguished and active Corporate Advisory Board. The department also works closely with high-quality academic institutions and colleagues worldwide and is honored to have an active and highly respected Academic Advisory Board. Both boards meet regularly to review the department’s programs, research and plans. In this manner, the department stays informed, meets the pragmatic and scholarly needs and critical challenges confronting technology and innovation executives and entrepreneurs, and assures that its courses and programs are state of the art and relevant.

Corporate Advisory Board Members
Mark Chardack  
Chief Financial Officer  
LextraNet.com  

Patrick S. Finn  
Director, Northeast Market Development  
CISCO Systems  

Edward Fitzpatrick  
First Deputy Controller  
City of New York  

John Gilbert  
Executive Vice President, COO

2 Credits

Department of Technology, Culture and Society

Head: Kristen Day

Mission Statement

The interdisciplinary Department of Technology, Culture and Society (TCS) focuses on critical engagement with technology and science through research and teaching. This mission is fulfilled in part by undergraduate degree programs, including Integrated Digital Media, B.S., Science and Technology Studies, B.S. and Sustainable Urban Environments, B.S., and by graduate programs in Integrated Digital Media, M.S., History of Science and Technology, M.S. and Environment-Behavior Studies, M.S.. The department is also responsible for NYU-Poly’s core curriculum in humanities and social sciences, which gives students a breadth of knowledge and perspective necessary for careers in technology and the sciences.

Department: Undergrad Cluster Curriculum: Core Requirements

The Cluster Concept

TCS offers humanities and social sciences elective courses that understand the relations among science, technology and society from three general approaches and modes of inquiry: Culture, Arts and Media; Science, Technology and Society; and Society, Environment and Globalization (see below). This integrated approach to science, technology and the humanities and social
sciences provides engineering and science majors with a concrete and focused foundation for their fields. The humanities and social sciences clusters are:

**Culture, Arts and Media (CAM)**

The CAM cluster explores how cultural practices and artifacts in a wide range of media reflect, influence and interact with developments in science and technology. Courses are based on philosophy, media studies, music, literary studies, art history, rhetoric and anthropology.

**Science, Technology and Society (STS)**

STS cluster courses explore the interrelationships among science, technology, culture and society. STS unites and investigates a myriad of disciplines, including history, philosophy, rhetoric, literary studies and sociology. The questions posed are: How do science and technology shape society? How do social processes frame scientific and technological enterprises? What is the relationship between the content of scientific and technological knowledge and the social and intellectual context in which it is created?

**Society, Environment and Globalization (SEG)**

Courses in this cluster address the way the critical areas of society, environment and globalization are interlinked in the way they affect the experience of modern life. Coming from the complementary perspectives of the humanities and social sciences, SEG courses provide students with a broad and multicultural perspective on how environmental issues and global exchange in this “flat world” are changing society, here and across the world.

**Required Courses for Fulfilling the First-Year Writing Requirement (Two courses, 6 credits):**

i. *Fall:* EW 1013 - Writing the Essay
ii. *Spring:* EW 1023 - The Advanced College Essay

**Humanities and Social Sciences Elective Requirement (Six courses, 18 credits)**

Students may choose six courses from any humanities and social sciences cluster. These six electives can be within a single cluster or across multiple clusters. For optimal breadth of experience, students are encouraged to take humanities and social sciences electives across clusters and/or across disciplines within a cluster. These six humanities and social sciences electives must satisfy the following constraints:

a. At least one of these six must be a 3xx/4xx level humanities and social science elective.

b. At least one of these six must be a writing-intensive humanities and social science elective, labeled by “W.”

**Course Types**

TCS offers four types of undergraduate courses, as well as graduate courses:

**First-Year Writing Courses** are required for all students in Bachelor of Science programs. They count toward the school’s general-education requirement and the state’s Liberal Arts and Science requirement, and help meet requirements of the Accreditation Board for Engineering and Technology (ABET).

**Humanities and Social Sciences Electives** are open to all Bachelor of Science students, subject to prerequisites. They count toward the school’s general-education requirement and the state’s Liberal Arts and Science requirement, help meet ABET requirements and fulfill the Polytechnic mandate of a technology- and science-focused curriculum. Electives may be chosen from any CAM, STS or SEG cluster.
Writing-Intensive Humanities and Social Sciences Electives are writing-intensive humanities and social sciences courses designated with a “W” and open to all Bachelor of Science students, subject to prerequisites. Electives may be chosen from a CAM, STS or SEG cluster. Writing-intensive courses require:

i. A minimum of 15 pages of formal writing, not including informal writing and in-class exams;
ii. Explicit writing instructions;
iii. At least one formal written assignment that incorporates instructor response and student revision.

Studio Electives are creative practice courses in art and design disciplines, open to all Bachelor of Science students, subject to prerequisites. These courses may NOT be taken as humanities and social sciences electives to satisfy general-education humanities and social sciences requirements, but may be taken as technical or free electives.

N.B.: Courses that carry the following prefixe may NOT be used to fulfill the general humanities and social sciences requirements: DM (digital media).

Institutes Affiliated with the Department of Technology, Culture and Society

Brooklyn Experimental Media Garage (BXmC)

BXmC at NYU-Poly is truly experimental; it is the creative/research arm of NYU-Poly’s art and technology programs. BXmC works with the hard core of New York’s experimental multimedia scene: installation and performing artists, programmers and interaction designers and architects. BXmC develops new kinds of partnerships to create new genres and applications, especially those that need underlying technologies of the future such as: extreme modification of an open-source game engine, purpose-built multi-touch screen for music performance, peer-to-peer 3D streaming, live HD video switching using off-the-shelf components, a new high-performance VJ application to facilitate extension and reconfiguration on the fly…these are BXmC.

Cite Game Innovation Lab

Digital games have permeated our everyday lives and are driving technological and media innovation forward at a tremendous pace. Engaging in the core challenges that are driven by game development and design requires interdisciplinary skills and a rigorous empirical and experimentally-minded approach. The Game Innovation Lab is an exciting, dynamic and flexible space for research and learning that takes games as an innovation challenge. Core research and teaching activities are grounded in computer science, engineering, and user experience, with participation of researchers and educators from other allied disciplines. Sample projects in the Lab include user interface innovation (sensor-based tracking, multi-touch), network and video quality research, and research on games for learning.

Contact Information

Polytechnic Institute of NYU
Six MetroTech Center
Brooklyn, NY 11201
Tel: (718) 260-3231/3039

Degrees Offered

Bachelor of Science
• Integrated Digital Media, B.S.
• Science and Technology Studies, B.S.
• Sustainable Urban Environments, B.S.

Graduate Certificates

This certificate is awarded for successful completion of a 15-credit graduate-level sequence. Students must take two core courses and three electives. Certificates are offered in the following disciplines:

• Environment-Behavior Studies Graduate Certificate
• Integrated Digital Media Graduate Certificate

Master of Science

• Environment-Behavior Studies, M.S.
• History of Science and Technology, M.S.
• Integrated Digital Media, M.S.

Minors

Integrated Digital Media

Requirements: 15 credits of DM courses, of which 6 are at the 3xxx level or above.

Science and Technology Studies

The minor in STS required 16 credits consisting of:

1. Seminar requirement: STS 3003/W (3 credits).
2. Project requirement: STS 4401 Independent Study (1 credit): A written or oral presentation planned in consultation with an STS faculty adviser. This presentation analyzes the student's own senior project in their major from an STS perspective (such as social, philosophical, political, aesthetic).
3. Elective requirement: Remaining credit requirements (12 credits) must be satisfied by courses chosen from the STS electives list.

Requirements 1 and 2, and one of the STS electives (requirement 3) must be taken at NYU-Poly; the remaining elective requirements may be met with transfer credits.

The minor is open to all majors. For engineering or natural science majors, benefits of an STS minor include:

• An understanding of the conceptual, historical and cultural foundations of your major field.
• A rigorous humanistic education essential to the practice of science and engineering in our global society.
• Writing and communication skills that employers seek.

For other majors, benefits of an STS minor include:

• Exposure to key subjects in science and engineering fields and their impact on society, at a broad conceptual, year non-trivial, level.
• An appreciation of the problem-solving techniques and practiced that scientists and engineers engage in.
• Critical reasoning and analytical skills that employers seek.

Sustainable Urban Environments

The minor in SUE requires 15 credits consisting of at least two courses from the SUE core and three courses from any of those offered in the concentration. The minor in SUE is open to all majors.

Other Humanities and Social Sciences Minors
A minor can be obtained in any humanities and social sciences discipline for which there is an adequate number of courses. Such a minor consists of 15 credits in that discipline, unless otherwise specified. Consult the TCS department for information about which specific disciplines offer sufficient and appropriate courses, and further details of specific minor requirements.

**Faculty**

**Professors**

**Kristen Day**, Professor of Urban Planning and Department Head  
PhD, University of Wisconsin, Milwaukee  
*Urban design and behavior, design of urban environments for equity, health and well-being*

**Jean Gallagher**, Professor of English  
PhD, City University of New York Graduate Center  
*Feminist theory, 19th- and 20th-century American literature, composition and rhetoric*

**Myles W. Jackson**, Dibner Family Professor of History and Philosophy of Science and Technology, Director of Science and Technology Studies, and Professor of the History of Science and Technology at the Gallatin School of Individualized Study, New York University  
PhD, Cambridge University  
*History of 18th- and 19th-century German and British science and technology, gene patenting and intellectual property in the United States and Europe, bioethics*

**Sylvia Kasey Marks**, Professor of English  
PhD, Princeton University  
*Shakespeare, Samuel Richardson, the 18th- and 19th-century British novel, public speaking, expository writing*

**Richard E. Wener**, Professor of Environmental Psychology  
PhD, University of Illinois at Chicago  
*Environmental psychology*

**Associate Professors**

**Jonathan Bain**, Associate Professor of Philosophy of Science  
PhD, University of Pittsburgh  
*Quantum theory, philosophy of space and time*

**Teresa Feroli**, Associate Professor of English  
PhD, Cornell University  
*Renaissance literature, Shakespeare, women’s studies*

**Lowell L. Scheiner**, Associate Professor of Humanities and Communications  
MS, Columbia University Graduate School of Journalism  
MA, Columbia University  
*Technical writing, journalism*

**Jonathan Soffer**, Associate Professor of History  
PhD, Columbia University  
JD, University of Denver  
*Twentieth-century American political and foreign-relations history, urban history with a specialization in the history of New York City since 1945*
Romualdas Sviedrys, Associate Professor of History of Technology
PhD, Johns Hopkins University
Technology forecasting and technology assessment, history of technology and science

Assistant Professor

Luke Dubois, Assistant Professor of Digital Media
PhD, Columbia University
Computer music, real-time multimedia

Industry Faculty

Jerry MacArthur Hultin, Industry Professor of Law, Management and Public Policy; President of Polytechnic Institute of NYU
JD, Yale University
Innovation management, global development, modern university education, technology policy

Carl Skelton, Industry Professor of Digital Media, Director of BXmC
MVA, University of Alberta (Canada)
Digital media

Harold P. Sjursen, Industry Professor of Philosophy
PhD, New School University
History of philosophy, ethics, philosophy of science and technology

Instructors

Allan Goldstein, Instructor of English
BA, University of Denver
English as a second language, developmental writing, writing nonfiction/personal experience writing, intellectual disability advocate

Christopher Leslie, Instructor of New Media and Science and Technology Studies
PhD, City University of New York Graduate Center
History of media and technology, science of difference, science fiction

James P. Lewis, Instructor of Psychology
MA, Stony Brook University
Humanistic psychology

Elisa Linsky, Instructor of Technical Communications
MS, Polytechnic Institute of NYU
Technical writing, technical presentations, writing across the curriculum

Alan M. Nadler, Instructor of English
MFA, Columbia University
Contemporary poetry, the European novel

Lecturer
Alph Edwards, Lecturer of English  
MA, Hunter College  
Developmental writing

Donald S. Phillips, Lecturer of Psychology  
BS, Polytechnic University  
Experimental and physiological psychology, physical anthropology, paleontology

Affiliated Professor

Katherine Isbister, Associate Professor of Digital Media and Computer Science and Engineering, Director of CITE Game Innovation Lab  
PhD, Stanford University  
Social psychological and affective approaches to human-computer interface, with special attention to games and other leisure and social technologies; embodied conversational agents and computer-game characters

Faculty Emeriti

Lester Bumas  
John G. Cavanna  
Wolhee Choe  
Duane DeVries  
Anne Eisenberg  
Marvin Gettleman  
Helmut Gruber  
Louis Menashe  
David Mermelstein  
F. David Mulcahy  
Bernard Rechtschaffen  
Thomas B. Settle

Humanities and Social Sciences Electives List

JW 6313 Proposal Writing

3 Credits

URB 2043 Methods for Studying Urban Environments

3 Credits This course provides students with a foundation for understanding and using social science research methods to study urban environments. In this course, students will gain an understanding of quantitative and qualitative approaches to social science research. They will be introduced to a range of data collection methods that are used to study urban environments and also strategies for data analysis. The course will involve a group research project with a real world client, as well as lectures, discussions, a group presentation and paper, exams, readings and several assignments.
Prerequisite(s): EW 1013 and EW 1023 or equivalent

**URB 2053 Introduction to Urban Policy**

*3 Credits* The purpose of this course is to introduce students to the process and some of the major substantive issues in urban policy and politics in the United States, with some transnational contrasts. These include some of the basic issues of any political system: how cities function as part of a global urban network; the structure of decisionmaking, the allocation of resources and delivery of services.

*Prerequisite(s):* EW 1023 The Advanced College Essay

**URB 4024 Capstone Project**

*4 Credits* The capstone is a research project that presents SUE students with an opportunity to translate previous coursework into an applied research effort. This is a real-world based course in which students work in teams to identify, research, and propose solutions to a multidisciplinary urban issue, supervised by an SUE faculty member in weekly class discussions. The field research should be supported by library research and culminates in a written and oral report.

*Prerequisite(s):* Senior Status, permission of SUE faculty advisor. Note: Does not satisfy a humanities and social sciences elective.

**URB 4033 Internship**

*3 Credits* Students may undertake an internship for academic credit with an appropriate private, public, or non-profit agency or firm. The internship is an opportunity to extend learning outside of the classroom into a real world setting, and to explore career options tied to the major. Students complete 140 hours at the internship site and attend occasional class meetings. The course involves completing a learning contract, regular reflections, assignments, and a final presentation.

*Prerequisite(s):* Prerequisite: IDM/SUE/STS majors only. Permission of instructor required.

**Enterprise Learning**

**Interdisciplinary**

**NYU-ePoly**
General Engineering

Goals and Objectives

A prime mission of Polytechnic’s first-year college experience is to teach students how to learn. Students will be equipped for life in our rapidly changing world, where it is especially true in the science and engineering studies that education is a lifetime commitment. Polytechnic’s first-year curriculum emphasizes learning by doing through the repeated application of new concepts and skills in practical situations of increasing complexity and sophistication. Faculty leadership of learning by doing involves mentoring of individual students, exploring different learning styles, encouraging working in teams on real professional problems, and modeling what it means to be a superb professional and an involved citizen.

Required Courses

All first-year students, including transfer students with fewer than 6 credits, are required to enroll in EG 1001, the Engineering and Technology Forum course. Students majoring in engineering and technology disciplines will also enroll in EG 1003, a hands-on engineering analysis and design course in their first semester of study at Polytechnic. In this course, students engage in relevant engineering design projects. Through active involvement and teamwork, students follow practices and approaches used in industry and research entities to solve real-world engineering problems.

Faculty

Industry Professors

Gunter Georgi, PE, Industry Professor, Director of General Engineering
ME, Columbia University
MSME, Columbia University
BSME, Cooper Union

Dimitri James Cordista, Industry Assistant Professor
BSIE, Polytechnic University

David Lefer, Industry Professor, Director of the Engineering and Technology Forum
MS, Columbia University

Routes to Polytechnic

- Brooklyn Campus
- Long Island Graduate Center
- Westchester Graduate Center

Brooklyn Campus
By Subway from all Boroughs:

A, C or F train to Jay Street-Borough Hall; or the 1, 2, 4 or 5 subway to Borough Hall (walk to Fulton Street and make a left onto Jay Street); or the R or M to Lawrence Street.

By Car from Manhattan:

Take the FDR Drive to the Brooklyn Bridge. Make the first left after the bridge onto Tillary Street and a right onto Jay Street.

By Car from Queens or the Bronx:

Take the Brooklyn-Queens Expressway to Tillary Street and then left onto Jay Street.

By Car from Staten Island:

Take the Verrazano Narrows Bridge to the Brooklyn-Queens Expressway to the Tillary Street exit. Make a left onto Jay Street.

By Car from New Jersey:

From the George Washington Bridge, take the Harlem River Drive to the FDR Drive or Holland Tunnel to Brooklyn Bridge. (Continue as from Manhattan)

By Train from Brooklyn or Long Island:

Take the Long Island Rail Road to Atlantic Avenue (last stop in Brooklyn). Then take a taxi or Bus #B67 to MetroTech on Jay Street, or the R or M subway to Lawrence Street. It’s about a one-mile walk from the LIRR station: go to the Fulton Mall and make a left, then a right onto Jay Street.

By Car from Brooklyn or Long Island:

Take the Brooklyn-Queens Expressway to the Tillary Street exit. Go left onto Jay Street.

By Car from Westchester:

Take the Major Deegan or Cross Bronx Expwy. to FDR Drive to Brooklyn Bridge or the Triborough, Whitestone or Throgs Neck Bridge to Brooklyn-Queens Expwy. to Tillary St. From there take a left onto Jay St.

PUBLIC PARKING is available at the Marriott Hotel

Long Island Graduate Center

From New York City & Long Island:
Take the Long Island Expressway (I-495) East to exit 49S (Rt. 110 S/Amityville). Merge onto the S. Service Rd. and turn right onto NY-110 S. (approximately half a mile). Turn left onto Baylis Rd. (approximately half a mile). Turn left onto Maxess Rd. (The Long Island Graduate Center is on the right within 150 yards. Enter through North entrance of 105 Maxess Road).

**From Westchester:**

**Westchester Graduate Center**

**From New York City:**

Take New York 9A / West Side Highway to Saw Mill River Parkway North. Or I-278 to the Triborogh Bridge to I-87 North, exit at I-287 East to Saw Mill River Parkway North (Exit 1). Travel north on Saw Mill River Parkway for 3 miles after the interchange for I-287 to Exit 25 for Hawthorne (Route 9A). Turn left at light onto Route 9A northbound. Polytechnic Institute is on the right side of road.

**From New Jersey and Downstate New York:**

Take I-87 South (New York State Thruway) to the Tappan Zee Bridge. After the bridge, take I-287 East to Saw Mill River Parkway North (Exit 1). Travel north 3 miles to Exit 25 for Hawthorne (Route 9A). Turn left at light onto Route 9A northbound. Polytechnic is on the right side of road.

**From Northern Westchester and the Hudson Valley:**

Take the Taconic State Parkway South or Saw Mill River Parkway South to the Sprain Brook Parkway. Exit at Route 100C. Make a right onto Route 100C westbound and travel 3/4 mile to Route 9A North, entrance on right. Travel north on Route 9A for 2 miles. Polytechnic is on the right.

**From Connecticut and Southern Westchester:**

Take I-95 to I-287 West (Cross Westchester Expressway) to Route 9A (Exit 2) North. Travel north 3 miles. Polytechnic is on the right.
